# Spherical Plain Bearings

CAT. No. 5301-II / E

## Warranty

NTN warrants, to the original purchaser only, that the delivered product which is the subject of this sale (a) will conform to drawings and specifications mutually established in writing as applicable to the contract, and (b) be free from defects in material or fabrication. The duration of this warranty is one year from date of delivery. If the buyer discovers within this period a failure of the product to conform to drawings or specifications, or a defect in material or fabrication, it must promptly notify NTN in writing. In no event shall such notification be received by NTN later than 13 months from the date of delivery. Within a reasonable time after such notification, NTN will, at its option, (a) correct any failure of the product to conform to drawings, specifications or any defect in material or workmanship, with either replacement or repair of the product, or (b) refund, in part or in whole, the purchase price. Such replacement and repair, excluding charges for labor, is at NTN's expense. All warranty service will be performed at service centers designated by NTN. These remedies are the purchaser's exclusive remedies for breach of warranty.

NTN does not warrant (a) any product, components or parts not manufactured by NTN, (b) defects caused by failure to provide a suitable installation environment for the product, (c) damage caused by use of the product for purposes other than those for which it was designed, (d) damage caused by disasters such as fire, flood, wind, and lightning, (e) damage caused by unauthorized attachments or modification, (f) damage during shipment, or (g) any other abuse or misuse by the purchaser.

**THE FOREGOING WARRANTIES ARE IN LIEU OF ALL OTHER WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.**

In no case shall NTN be liable for any special, incidental, or consequential damages based upon breach of warranty, breach of contract, negligence, strict tort, or any other legal theory, and in no case shall total liability of NTN exceed the purchase price of the part upon which such liability is based. Such damages include, but are not limited to, loss of profits, loss of savings or revenue, loss of use of the product or any associated equipment, cost of capital, cost of any substitute equipment, facilities or services, downtime, the claims of third parties including customers, and injury to property. Some states do not allow limits on warranties, or on remedies for breach in certain transactions. In such states, the limits in this paragraph and in paragraph (2) shall apply to the extent allowable under case law and statutes in such states.

Any action for breach of warranty or any other legal theory must be commenced within 15 months following delivery of the goods.

Unless modified in a writing signed by both parties, this agreement is understood to be the complete and exclusive agreement between the parties, superceding all prior agreements, oral or written, and all other communications between the parties relating to the subject matter of this agreement. No employee of NTN or any other party is authorized to make any warranty in addition to those made in this agreement.

This agreement allocates the risks of product failure between NTN and the purchaser. This allocation is recognized by both parties and is reflected in the price of the goods. The purchaser acknowledges that it has read this agreement, understands it, and is bound by its terms.

------------------	----

Spherical plain bearings are used in equipment that undergo articulated movement, involving oscillating or aligning motions.

NTN spherical plain bearings are classified broadly into the self-lubricating type with a solid PTFE based liner and the lubrication type in which contact between the inner and outer rings is metal-to-metal.

## 1. Types of Spherical Plain Bearings

### 1.1 Self-lubricating type spherical plain bearings

Self-lubricating spherical plain bearings are primarily intended for situations where a long life, free from maintenance and lubrication requirements, is desired. They are also used in parts of machines where lubrication would be difficult.

In the NTN self-lubricating spherical plain bearing a self-lubricating PTFE based liner is securely bonded to the outer ring.

Therefore, lubrication, maintenance and inspection are necessary. As there is no oil staining, the bearing is always clean.

It is particularly suitable where the load works in one direction only or where there is a low frequency of oscillating movement.

The inner ring is made of high carbon chromium bearing steel and its sliding surface is hard chromium plated.

Where higher pressures are involved, a special type of spherical plain bearing with a steel mesh reinforced liner is available. Please contact NTN for details of this item.

The following types of NTN spherical plain bearings are available:

- SAR 1 Series : Equivalent to ISO "E" series
- SAR 1 · · SS Series : Equivalent to ISO "E" series, with seal
- SAR 2 Series : Inch series
- SAR 4 Series : Special dimension series

All of these types are suitable for a temperature range of  $-50^{\circ}\text{C}$  ( $-58^{\circ}\text{F}$ ) to  $+100^{\circ}\text{C}$  ( $+212^{\circ}\text{F}$ ).

### 1.2 Lubrication type spherical plain bearings

Lubrication type spherical plain bearings feature sliding surfaces where both the inner and outer rings are steel. The outer ring has a single fracture for assembly. The absence of a fitting groove greatly increases the strength of the bearing.

These bearings are particularly suited for subjection to impact loads or alternating loads.

Both the inner and outer rings are manufactured from high carbon chromium bearing steel. After heat treatment and grinding, their surfaces are treated with a phosphate film, which renders them highly resistant to rust. Furthermore, their sliding surfaces are coated with molybdenum disulfide, which provides very effective lubrication of the bearing in its initial stage of operation. Both the inner and outer rings are provided with an oil hole, so that oil can be inserted either from the shaft or from the housing.

The NTN lubrication type spherical plain bearing comes in the following types;

- SA 1 Series : Equivalent to ISO "E" series
- SA 1 · · SS Series : Equivalent to ISO "E" series, with seal
- SA 2 Series : Inch series
- SA 4 Series : Special dimensions series
- SAT Series : Thrust type series

The temperature range for the SA1 · · SS series is  $-20^{\circ}\text{C}$  ( $-4^{\circ}\text{F}$ ) to  $+70^{\circ}\text{C}$  ( $+158^{\circ}\text{F}$ ), but for the other series, the temperature range is  $-50^{\circ}\text{C}$  ( $-58^{\circ}\text{F}$ ) to  $+150^{\circ}\text{C}$  ( $+302^{\circ}\text{F}$ ).

## 2. Tolerances of Spherical Plain Bearings

### Definitions.

The symbols used in the tolerance table are defined as follows;

#### Symbols

- $d$  = bearing bore diameter, nominal
- $\Delta d_{mp}$  = single plane mean bore diameter deviation
- $Vd_p$  = bore diameter variation in a single radial plane
- $Vd_{mp}$  = mean bore diameter variation
- $\Delta B_s$  = deviation of a single width of the inner ring
- $D$  = bearing outside diameter, nominal
- $\Delta D_{mp}$  = single plane mean outside diameter deviation
- $VD_p$  = outside diameter variation in a single radial plane
- $VD_{mp}$  = mean outside diameter variation
- $\Delta C_s$  = deviation of a single width of the outer ring
- $\Delta T_s$  = deviation of mean height of thrust spherical plain bearings

Table 1 gives the dimensions of oil holes and grooves in the inner rings and the outer rings.

Two equally spaced oil holes are provided.

Four equally spaced oil holes are provided if the nominal bearing outside diameter exceeds 200mm. (7.8740 inch).

**Table 1 Dimensions of lubrication grooves and holes**

## 3. Loads Acting on Spherical Plain Bearings

### 3.1 Equivalent radial load

Loads applying to spherical plain bearings include a radial load, that is, a load acting vertically to the axis of the bearing, and a thrust load which acts parallel to it. Arbitrary directions of the load must be divided into radial and thrust loads, and an equivalent radial load is obtained by the following formula (1):

$$P_r = F_r + YF_a \dots\dots\dots (1)$$

where in

$P_r$  = equivalent radial load, N, lbf

$F_r$  = radial load, N, lbf

$F_a$  = thrust load, N, lbf

$Y$  = axial load factor

Axial load factors  $Y$  to be used are shown in Table 4 below.

In the case of the self-lubricating type, however, the thrust load should not exceed the permissible axial loads  $P_t$  mentioned in the dimension table.

**Table 4 Axial load factor  $Y$**

$F_a/F_r$	0.1	0.2	0.3	0.4	0.5	0.5 <
Bearing types						
Self-lubrication type	1	2	3	Unfit		
Lubrication type	1	2	3	4	5	Unfit

### 3.2 Fluctuating load

When the magnitude of load applied to the bearing is not constant but is subject to simple periodical fluctuations, an average load can be obtained by the following formula (2):

$$F_m = \frac{F_{min} + 2F_{max}}{3} \dots\dots\dots (2)$$

where

$F_m$  = average load, N, lbf

$F_{min}$  = minimum fluctuating load, N, lbf

$F_{max}$  = maximum fluctuating load, N, lbf

## 4. Selection of Spherical Plain Bearings

In the selection of NTN spherical plain bearings, the choice of either the self-lubricating type or the lubrication type is determined by the part of the machine where it is to be used, and by operating conditions such as surface pressure, direction in which the load applies, operating temperature, and lubricating conditions.

### 4.1 Dynamic load and dynamic load rating

Permissible loads for spherical plain bearings against their dynamic load rating vary with their types and with the nature of the loads applying. The limits for these loads are shown in Table 5.

**Table 5 Limit loads**

Bearing type \ Direction of load	Load acting in one direction	Load acting in a variable direction
Self-lubricating	1 $C_d$	0.5 $C_d$
Lubrication type	0.3 $C_d$	0.6 $C_d$

In the case of the self-lubricating type, the influence of the operating temperature on the dynamic load rating must be taken into account, using the following formula (3).

$$C_{dt} = f_t \cdot C_d \dots \dots \dots (3)$$

where,

$C_{dt}$  = dynamic load rating with temperature factor considered taken into account, N, **lbf**

$C_d$  = dynamic load rating, N, **lbf**  
(see the dimensions table)

$f_t$  = temperature factor (see Fig. 1)

### 4.2 Permissible thrust load

The limit of a thrust load is acting on spherical plain bearings is determined by the ratio of the thrust load  $F_a$  and the radial load  $F_r$  as follows:

Self-lubricating type bearing:

$$F_a / F_r \leq 0.3$$

Lubrication type bearing:

$$F_a / F_r \leq 0.5$$

In the case of the self-lubricating type bearing, however, the thrust load should not exceed the permissible axial load  $P_t$  mentioned in the table of dimensions. Further-more,  $P_t$  must be adjusted by a temperature factor  $f_t$ , as shown in Fig. 1.

**Fig. 1 Temperature factor  $f_t$**

### 4.3 Sliding speed and load

It is recommended that NTN spherical plain bearings be used within the permissible range of values as shown in Fig. 2, for the relationship between the sliding speed  $V$  and the load  $P$  applied to the bearing. Should you desire to use them beyond this range, please consult NTN.

The sliding speed can be obtained by the following formula (4) :

$$V = 8.7 \times 10^{-6} (d + D) \cdot \theta \cdot f \dots \dots \dots (4)$$

where,

$V$  = sliding speed, m/min, **ft/min**

$d$  = bore of the bearing, mm, **inch**

$D$  = O.D. of the bearing, mm, **inch**

$\theta$  = oscillating angle deg.

$f$  = frequency of oscillation cpm

## 4.4 Static load and load rating

In cases where the load applied to the bearing is static or where the bearing undergoes oscillating movement only at rare intervals, the limiting maximum load applied to the bearing is as shown in Table 6.

**Table 6 Limit loads for static use**

Bearing type	Permissible load (max)	Remarks
Self-lubricating type	1.5 times $C_d$	The influence of temperature must be taken into account. (refer to formula (3).)
Lubrication type	1/6 of $C_s$	For general use.
	1/4 of $C_s$	Applicable where the frequency of use is very low and the bearing is well lubricated.

$C_d$  = dynamic load rating  
 $C_s$  = static load rating

Where a static load close to  $C_s$  is applied, it is also necessary to review the strength of the shaft.

**Fig. 2 Permissible  $P - V$  value curve**

## 5. Life of Spherical Plain Bearings

### 5.1 Self-lubricating type bearings

The life of self-lubricating type bearings is determined by the degree of wear of the PTFE based material on the sliding part. The wear progresses in stages, through initial wear, normal wear and abnormal wear. The time of occurrence of abnormal wear is considered as the limit to continuous use of the bearing.

This limit to the continuous use of a bearing is, under conditions of normal wear expressed in terms of the total sliding distance covered before the amount of wear (amount of increase in clearance) reaches a certain limit value.

The total sliding distance S, with the amount of wear taken at 0.1 mm (0.004inch), is shown in Fig. 3. In general use, bearings can be continuously used for two to three (2-3) times the values obtained from this graph.

Fig. 3 Load applied to the bearing and the total sliding distance

### 5.2 Lubrication type bearings

The total service life of lubrication type bearings can be obtained from the following formula (5):

$$L_h = \frac{f_w \cdot f_1 \cdot L_1}{60 \cdot f} \dots\dots\dots (5)$$

where,

- $L_h$  : total service life h
- $f_w$  : lubrication factor

$f_1$  : factor of load direction

$L_1$  : initial service life

$f$  : frequency of oscillation cpm

The procedure for this calculation is as follows:

- (1) Sliding speed  $V$  ..... from formula (4)
- (2) Speed factor  $f_n$  ..... from Fig. 4
- (3) Initial service life  $L_1$  ..... from Fig. 5
- (4) Number of oscillations during the interval of relubrication :  $Z_w$  ..... from formula (6)

$$Z_w = 60 \cdot f \cdot H \dots\dots\dots (6)$$

where,

$f$  : frequency of oscillation cpm

$H$  : interval of relubrications h

(5) Lubrication factor  $f_w$  .....from Fig. 6

(6) Factor of load direction  $f_1$ .....from Table 7

Using the values obtained as above, the total service life is to be calculated from formula (5) .

Table 7 Factor of load direction

Load conditions	$f_1$
Load acting in one direction	1
Load acting in a variable direction	5

Fig. 4 Speed factor  $f_n$

**Example: SA1-20B**

Load condition  $\frac{C_d}{P} = 6$

Oscillation angle  $\theta = 10^\circ$

Speed factor  $f_n = 0.5$

Initial service life  $L_1$ , in this instance, works out as:

$L_1 = 5 \times 10^5$  times

When a bearing of the SA4 series is used, move the SA4 scale to the position of the SA1 scale, and then connect its size number with its  $\frac{C_d}{P}$  value.

**Fig. 5** Nomogram of the initial service life  $L_1$ , (Lubrication type bearings)

**Fig. 6** Lubrication factor  $f_w$

## 6. Recommended Fit and Internal Clearance

### 6.1 Recommended fit

The recommended fits for NTN self-lubricating type and lubrication type spherical plain bearings are shown in Tables 8 and 9.

**Table 8 Recommended fit for self-lubricating type spherical plain bearings**

Operating conditions		Fit		
		Shaft	Housing	
			Steel	Light alloy
Rotating inner ring load	Normal load	k6 <sup>①</sup>	H7	J7
	Heavy load	m6 <sup>①</sup>		
Rotating outer ring load	Normal load	h6	K7 <sup>②</sup>	M7 <sup>②</sup>
	Heavy load		M7 <sup>②</sup>	—

Notes:

- ① When mounting the bearing, take special care not to apply a large axial load. When it is necessary, for convenience of fitting, to adopt a clearance fit for mounting the bearing on the shaft, fit "h6" or "g6" may be used. In this case the surface of the shaft must be hardened and it is recommended that the fitting surfaces be coated with molybdenum disulphide.
- ② When it is necessary for the bearing to be able to move in the axial direction in the housing, or when the load is light, fit "H7" may be used. In these cases, it is recommended that the fitting surfaces be coated with molybdenum disulphide. Use special care not to let molybdenum disulphide enter into the sliding surface of the bearings.

**Table 9 Recommended fit for lubrication type spherical plain bearings**

Operating conditions		Fit		
		Shaft	Housing	
			Steel	Light alloy
Rotating inner ring load	Normal load	k6 <sup>①</sup>	J7	K7
	Heavy load	m6 <sup>①</sup>		
Rotating outer ring load	Normal load	h6 <sup>②</sup>	K7	M7
	Heavy load		N7	P7

Notes:

- ① When it is necessary, for convenience of fitting, to adopt a clearance fit for mounting the bearing on the shaft, fit "h6" or "g6" may be used. In this instance, however, the surface of the shaft must be hardened and it is recommended that the fitting surfaces be coated with molybdenum disulphide.
- ② When the sliding speed is high, fit "j6" is recommended.

## 6.2 Internal bearing clearance

Internal clearance of NTN self-lubricating type and lubrication type spherical plain bearings are shown in Table 10.

**Table 10 Internal clearance**

Nominal bore $d$				Self-lubricating type				Lubrication type			
mm		inch		min		max		min		max	
over	incl.	over	incl.	$\mu\text{m}$	0.0001 inch	$\mu\text{m}$	0.0001 inch	$\mu\text{m}$	0.0001 inch	$\mu\text{m}$	0.0001 inch

30	50	1.1811	1.9685	15	6	60	24	70	28	120	47
50	80	1.9685	3.1496	18	7	72	28	80	31	150	59
80	120	3.1496	4.7244	—	—	—	—	100	39	180	71
120	180	4.7244	7.0866	—	—	—	—	120	47	210	83
180	250	7.0866	9.8245	—	—	—	—	170	67	270	106
250	315	9.8425	12.4016	—	—	—	—	200	79	310	122

Notes: Tolerance in inches are converted from the original figures specified in  $\mu\text{m}$  and rounded for reference.

## 7. Cautions to Installation

To install the oil lubricating bearing to the housing, position the bearing so that the cut in the outer ring shall be perpendicular to the load acting direction as illustrated in Fig. 7.

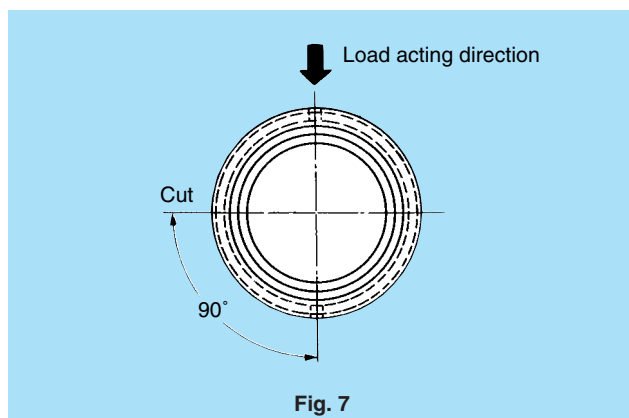

Fig. 7
