<i>MachLine, high precision standard bearing for machine tools</i>	250
<i>MachLine, high speed precision for machine tools</i>	256

Single-row angular-contact ball bearings

Definition and capabilities

Always mounted in opposition to another bearing of same type, they offer high mounting stiffness, especially when preloaded.

→ Definition

■ Cage

Standard dimension bearings are equipped with either a metal cage or a synthetic material cage. In the latter case the maximum continuous operating temperature is 120°C or 248°F (150°C peak or 302°F peak).

Large-sized bearings are equipped with a machined brass cage.

■ Contact angle

Angular-contact ball bearings of normal precision have a contact angle of 40° (suffix B). Some bearings have a contact angle of 30°, in which case the bearing reference does not have the B suffix.

→ Capabilities

■ Load and speed

These bearings are designed to:

- withstand combined loads with a predominant axial component
- withstand loads in one direction only (they must be mounted in opposition with bearings of the same type)
- accept relatively high speeds of rotation

$$F_a / F_r \geq 1$$

■ Misalignment

Assembly made up of a single bearing

Slight misalignment between the shaft and housing is acceptable. The value depends on the assembly clearance: from 0.10° to 0.15° if the assembly clearance is 0.06° in the case of a preloaded assembly.

Assembly made up of two bearings

In this case, the assembly is similar to a double-row ball bearing and the acceptable misalignment values are very low, in the range of 0.06°.

Variants

■ Bearings for universal matching (suffix BG)

The bearings in the 72 ... BG, 73 ... BG series can be assembled in pairs to form a single pillow block. They are supplied individually and can be matched in either an X, O or Tandem arrangement.

Arrangement	Characteristics
Face-to-face or X arrangement (type DF) 	This arrangement constitutes a single assembly. Another bearing is needed to form the second pillow block of the shaft.
Back-to-back or O arrangement (type DB) 	Good rigidity under tilting torque. This assembly can in some cases ensure shaft retention on its own thanks to the distance between the load application point.
Tandem (type DT) 	For very high axial loads but in one direction only. This arrangement constitutes a single assembly; another bearing must be mounted in the opposite direction to form the second assembly of the shaft.

Other variants can give assemblies with a greater or lesser amount of preload (suffix BGL or BGO); they requires usually a prior technical study.

On request these bearings are supplied with a maximum runout mark on the inner ring. When the two bearings are assembled, their respective markings must be aligned.

Single-row angular-contact ball bearings *(continued)*

Tolerances and clearances

■ Tolerances

Usually manufactured in the normal tolerance class.

Single-row ball bearings can be supplied on request with all or specified characteristics in tolerance classes 6 and 5 (e.g. bore or axial run-out in tolerance class 6).

■ Axial clearance on assembly with two separate bearings

These bearings are always assembled in opposition, and their internal clearance is determined by adjusting the axial clearance of the shaft at the time of assembly.

For information, the relationship between the axial clearance and the radial clearance is given by the formula:

$$J_r = 0.83 J_a$$

These bearings can be installed preloaded if needed to increase the axial rigidity of an assembly. The maximum speed of rotation is then reduced, and depends on the value of the preload. Consult SNR.

The aim of adjusting an assembly comprising two angular-contact ball bearings is to adjust the axial clearance, that is to say the initial relative position of the inner rings with respect to the outer rings, so that the bearings are positioned in the best possible operating conditions, while at the same time satisfying the specific assembly requirements (precision of rotation, rigidity, vibration, heating, etc.). The adjustment is defined either by an axial clearance or a preload.

The optimum preload of an assembly is determined according to the application specifications (rigidity, precision, temperature, vibration, etc.). Whatever the case, consult SNR.

The assembly and adjustment conditions affect the clearance of the assembly. Type BG bearings usually have reduced residual clearance after assembly.

■ Axial clearance of a BG assembly

The clearance of an assembly (X or O arrangement) is defined by the protrusion d_e of one ring with respect to the other.

Bearing bore		Protusion value in μm
from	to	
10	30	8 - 19
35	50	8 - 20
55	80	11 - 23
85	110	17 - 29
115	180	20 - 32

The axial clearance of the assembly is calculated as follows:

- mean theoretical axial clearance:

$$2 d_e$$

- radial reduction of clearance due to interference fits:

$$\Delta J_r$$

- mean axial clearance of the assembly:

$$J_a = 2 d_e - (\Delta J_r / 0.83)$$

By applying this formula to the calculation of probable tolerances, one obtains a minimum clearance value close to zero with a conventional assembly (interference fit on shaft with a $j6/k6$ tolerance and clearance fit in the housing with an $H7/J7$ tolerance).

Single-row angular-contact ball bearings *(continued)*

Design criteria

■ Bearing life

■ Shaft mounted on two single bearings

Equivalent dynamic load

The axial equilibrium of the shaft depends not only on the external forces applied to it, but also on the forces induced by the radial loads applied to each bearing.

Equivalent static load

Its value P_0 is the greater of the two values obtained using the following formula:

$$P_0 = F_r$$

$$P_0 = 0.5 F_r + 0.26 F_a$$

■ Shaft with one of its two assemblies made up of two matched bearings in the 72...BG or 73...BG series

This assembly is considered as being made up of a single double-row ball bearing whose centre O is the midpoint of the distance CD between the load application points.

The arrangement of this type of assembly is hyperstatic. (3 seating points: E, C, D) and can only be likened approximately to an arrangement on two assemblies (seating points E and O) if the distance CD is less than $L/5$ and the rigidity of the assembly is satisfactory (misalignment $< 0.06^\circ$).

In all other cases, consult SNR.

■ Equivalent dynamic load of the double assembly (ISO 281 Standard)

Arrangements assembled in an O or X	$P = F_r + 0.55 F_a$	if	$F_a / F_r \leq 1.14$
	$P = 0.57 F_r + 0.93 F_a$	if	$F_a / F_r > 1.14$
Tandem assemblies	$P = F_r$	if	$F_a / F_r \leq 1.14$
	$P = 0.35 F_r + 0.57 F_a$	if	$F_a / F_r > 1.14$

■ Basic dynamic capacity of the double assembly

Basic dynamic capacity of an assembly of two identical matched bearings:

$$C_e = 1.625 C$$

■ Equivalent static load of a double assembly

For an O or X assembly:

$$P_0 = F_r + 0.52 F_a$$

For a tandem assembly, the value of P_0 is the greater of the two values obtained using the following formula:

$$P_0 = F_r$$

$$P_0 = 0.5 F_r + 0.26 F_a$$

■ Basic static capacity of the assemblies

The static capacity of the assembly of two identical bearings is twice that of a single bearing.

$$C_{0e} = 2 C_0$$

Suffixes

A	Optimised internal design with polyamide cage
B	Contact angle of 40°
BG	Contact angle of 40° and non-preloaded universal pairing
M	Machined brass cage centred on the balls

4-point angular-contact bearings

Definition and capabilities

4-point angular contact bearings accept axial loads in both directions. They are often associated with a radial contact bearing.

→ Definition

The design of this bearing results from the theoretical superposition of the two sections of matched angular-contact bearings in an X or O arrangement. The curvature of the raceways is consequently elliptical and displays two loading lines (contact angle 35°) which gives four points of contact on the balls.

The two-part inner ring can be filled with more balls than radial ball bearings.

■ Cage

The cage is usually made in machined brass centred on the inner or outer ring, joining the ring of balls to the outer ring.

→ Capabilities

■ Load and speed

These bearings are designed to:

- withstand combined loads with a predominant axial component

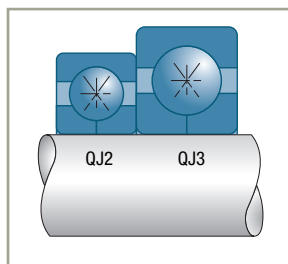

$$F_a / F_r \geq 1.25$$

- withstand axial loads in both directions
- accept relatively high speeds of rotation

■ Misalignment

The construction of these bearings limits them to very small misalignment values, in the range of 0.06°.

Series

Tolerances and clearances

→ Tolerances

These bearings are supplied in normal tolerance classes.

→ Clearance

■ Axial clearance

The axial clearance is not standardised.
The values are communicated by SNR on request.

■ Radial clearance

The relation between the axial clearance J_a and the corresponding radial clearance J_r can be calculated using the following approximation formula

$$J_r = 0.7 J_a$$

Design criteria

■ Bearing life

$$P = F_r + 0.66 F_a \quad \text{if } F_a / F_r \leq 0.95$$

■ Equivalent dynamic load

$$P = 0.6 F_r + 1.07 F_a \quad \text{if } F_a / F_r > 0.95$$

■ Equivalent static load

$$P_0 = F_r + 0.58 F_a$$

Installation/assembly criteria

The axial clearance of this bearing is determined for conventional mounting on a rotating shaft with an interference fit j6 or k6 type.

The fit of the housing must be loose (H7), hence the need to prevent the ring from rotating in certain applications (version suffix N2).

The two inner half-rings must be held tight axially against a shoulder.

In most applications, this bearing is considered like a single assembly. It can sometimes be used like a double assembly playing the role of two bearings, thanks to the distance between the load application points.

Suffixes

MA	Machined brass cage centred on the outer ring
N2	Two retention slots on the outer ring

Angular-contact bearings high precision MachLine® Range SNR

Definition and capabilities

Current machining integrates a whole series of properties which result from constant technological evolution and progress: high speed machining, downtime reduction, higher stiffness, integral sealing, maintenance cost-savings, ...

Machines provide increasingly higher performance levels in a context where productivity and environmental-friendliness must be paired.

The MachLine® range offers precise answers to all these issues.

Series and variations

■ High precision

- **SNR 71900V and 7000V series**, with excellent performance data to balance the need for speed, rigidity, capacity and precision.
- **7200G1 series**, specially designed to meet specifications set by applications with large, predominantly axial loads.
- **Variations** according to contact angle (C for 15° and H for 25°) and preload (light, medium or heavy).

■ Hybrid, ceramic balls CH

- **Possible variation** for all ranges, all series and all dimensions with Silicon Nitride balls and steel rings, combining the best qualities of the two materials.
- **Reduced operating temperature** and increased top speed. Reduced lubrication requirements as compared to a « conventional steel » bearing.
- **Increased rigidity and longer life.**

■ High speed ML

- Family made up of **series 71900 and 7000**, designed and developed by SNR to meet the increasingly stringent requirements in high speed mechanization.
- **Specially designed geometry**: reduction in ball diameter, increase in number of balls and optimization of cage guidance on outer ring.
- **Different variations** according to contact angle (C for 17° and H for 25°) and preload.

■ High speed sealed bearing MLE

- When oil lubrication is not required and grease lubrication is sufficient, SNR has a technically appropriate solution which is also economically attractive – the MLE family of bearings, **series 71900 and 7000**.
- **With nitrile rubber seals** on the outer ring, not in contact with the inner ring, the same top speed can be attained as with an open bearing lubricated with grease.
- **Variations** according to contact angle (C for 17° and H for 25°) and preload.

Design criteria

Consult our machine tools catalog MachLine®.
