## Warranty

NTN warrants, to the original purchaser only, that the delivered product which is the subject of this sale (a) will conform to drawings and specifications mutually established in writing as applicable to the contract, and (b) be free from defects in material or fabrication. The duration of this warranty is one year from date of delivery. If the buyer discovers within this period a failure of the product to conform to drawings or specifications, or a defect in material or fabrication, it must promptly notify NTN in writing. In no event shall such notification be received by NTN later than 13 months from the date of delivery. Within a reasonable time after such notification, NTN will, at its option, (a) correct any failure of the product to conform to drawings, specifications or any defect in material or workmanship, with either replacement or repair of the product, or (b) refund, in part or in whole, the purchase price. Such replacement and repair, excluding charges for labor, is at NTN's expense. All warranty service will be performed at service centers designated by NTN. These remedies are the purchaser's exclusive remedies for breach of warranty.

NTN does not warrant (a) any product, components or parts not manufactured by NTN, (b) defects caused by failure to provide a suitable installation environment for the product, (c) damage caused by use of the product for purposes other than those for which it was designed, (d) damage caused by disasters such as fire, flood, wind, and lightning, (e) damage caused by unauthorized attachments or modification, (f) damage during shipment, or (g) any other abuse or misuse by the purchaser.

**THE FOREGOING WARRANTIES ARE IN LIEU OF ALL OTHER WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.**

In no case shall NTN be liable for any special, incidental, or consequential damages based upon breach of warranty, breach of contract, negligence, strict tort, or any other legal theory, and in no case shall total liability of NTN exceed the purchase price of the part upon which such liability is based. Such damages include, but are not limited to, loss of profits, loss of savings or revenue, loss of use of the product or any associated equipment, cost of capital, cost of any substitute equipment, facilities or services, downtime, the claims of third parties including customers, and injury to property. Some states do not allow limits on warranties, or on remedies for breach in certain transactions. In such states, the limits in this paragraph and in paragraph (2) shall apply to the extent allowable under case law and statutes in such states.

Any action for breach of warranty or any other legal theory must be commenced within 15 months following delivery of the goods.

Unless modified in a writing signed by both parties, this agreement is understood to be the complete and exclusive agreement between the parties, superceding all prior agreements, oral or written, and all other communications between the parties relating to the subject matter of this agreement. No employee of NTN or any other party is authorized to make any warranty in addition to those made in this agreement.

This agreement allocates the risks of product failure between NTN and the purchaser. This allocation is recognized by both parties and is reflected in the price of the goods. The purchaser acknowledges that it has read this agreement, understands it, and is bound by its terms.

## 1. Classification and Characteristics of Rolling Bearings

### 1.1 Rolling bearing construction

Most rolling bearings consist of rings with raceway (inner ring and outer ring), rolling elements (either balls or rollers) and cage. The cage separates the rolling elements at regular intervals, holds them in place within the inner and outer raceways, and allows them to rotate freely.

#### Raceway (inner ring and outer ring) or raceway washer 1)

The surface on which rolling elements roll is called the "raceway surface". The load placed on the bearing is supported by this contact surface.

Generally the inner ring fits on the axle or shaft and the outer ring on the housing.

Note 1: The raceway of thrust bearing is called "raceway washer," the inner ring is called the "shaft raceway washer" and the outer ring is called the "housing raceway washer."

#### Rolling elements

Rolling elements classify in two types: balls and rollers. Rollers come in four types: cylindrical, needle, tapered, and spherical.

Balls geometrically contact with the raceway surfaces of the inner and outer rings at "points", while the contact surface of rollers is a "line" contact.

Theoretically, rolling bearings are so constructed as to allow the rolling elements to rotate orbitally while also rotating on their own axes at the same time.

#### Cages

Cages function to maintain rolling elements at a uniform pitch so load is never applied directly to the cage and to prevent the rolling elements from falling out when handling the bearing. Types of cages differ according to way they are manufactured, and include pressed, machined and formed cages.

### 1.2 Classification of rolling bearings

Rolling bearings divide into two main classifications: ball bearings and roller bearings. Ball bearings are classified according to their bearing ring configurations: deep groove type and angular contact type. Roller bearings on the other hand are classified according to the shape of the rollers: cylindrical, needle, tapered and spherical.

Rolling bearings can be further classified according to the direction in which the load is applied; radial bearings carry radial loads and thrust bearings carry axial loads.

Other classification methods include: 1) number of rolling rows (single, double, or 4-row), 2) separable and non-separable, in which either the inner ring or the outer ring can be detached.

There are also bearings designed for special applications, such as: railway car journal roller bearings, ball screw support bearings, turntable bearings, as well as linear motion bearings (linear ball bearings, linear roller bearings and linear flat roller bearings). Types of rolling bearings are given in Fig. 1.2.

Note: Bearings marked with an asterisk are not contained in this catalog.  
For details, see the catalog devoted to the concerned type of bearing.

## 1.3 Characteristics of rolling bearings

### 1.3.1 Characteristics of rolling bearings

Rolling bearings come in many shapes and varieties, each with its own distinctive features.

However, when compared with sliding bearings, rolling bearings all have the following advantages:

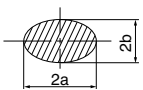

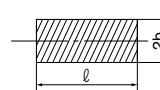

- (1) The starting friction coefficient is lower and there is little difference between this and the dynamic friction coefficient.
- (2) They are internationally standardized, interchangeable and readily obtainable.
- (3) They are easy to lubricate and consume less lubricant.
- (4) As a general rule, one bearing can carry both radial and axial loads at the same time.
- (5) May be used in either high or low temperature applications.
- (6) Bearing rigidity can be improved by preloading.

Construction, classes, and special features of rolling bearings are fully described in the boundary dimensions and bearing numbering system section.

### 1.3.2 Ball bearings and roller bearings

Table 1.1 gives a comparison of ball bearings and roller bearings.

Table 1.1 Comparison of ball bearings and roller bearings

	Ball bearings	Roller bearings
<b>Contact with raceway</b>	 <p><b>Point contact</b> Contact surface is oval when load is applied.</p>	 <p><b>Linear contact</b> Contact surface is generally rectangular when load is applied.</p>
<b>Characteristics</b>	Because of point contact there is little rolling resistance, ball bearings are suitable for low torque and high-speed applications. They also have superior acoustic characteristics.	Because of linear contact, rotational torque is higher for roller bearings than for ball bearings, but rigidity is also higher.
<b>Load capacity</b>	Load capacity is lower for ball bearings, but radial bearings are capable of bearing loads in both the radial and axial direction.	Load capacity is higher for roller bearings. Cylindrical roller bearings equipped with a lip can bear slight radial loads. Combining tapered roller bearings in pairs enables the bearings to bear an axial load in both directions.

### 1.3.3 Radial and thrust bearings

Almost all types of rolling bearings can carry both radial and axial loads at the same time.

Generally, bearings with a contact angle of less than 45° have a much greater radial load capacity and are classed as radial bearings; whereas bearings which have a contact angle over 45° have a greater axial load capacity and are classed as thrust bearings. There are also bearings classed as complex bearings which combine the loading characteristics of both radial and thrust bearings.

### 1.3.4 Standard bearings and special bearings

The boundary dimensions and shapes of bearings conforming to international standards are interchangeable and can be obtained easily and economically over the world over. It is therefore better to design mechanical equipment to use standard bearings.

However, depending on the type of machine they are to be used in, and the expected application and function, a non-standard or specially designed bearing may be best to use. Bearings that are adapted to specific applications, and "unit bearings" which are integrated (built-in) into a machine's components, and other specially designed bearings are also available.

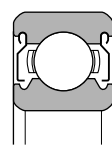

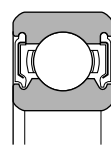

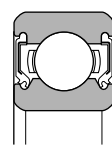

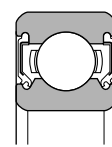

The feature of typical standard bearings are as follows:

## Deep groove ball bearings

The most common type of bearing, deep groove ball bearings are widely used in a variety of fields. Deep groove ball bearings include shield bearings and sealed bearings with grease make them easier to use.

Deep groove ball bearings also include bearings with a locating snap-ring to facilitate positioning when mounting the outer ring, expansion compensating bearings which absorb dimension variation of the bearing fitting surface due to housing temperature, and TAB bearings that are able to withstand contamination in the lubricating oil.

Table 1.2 Configuration of sealed ball bearings

Type and symbol	Shield	Sealed		
	Non-contact ZZ	Non-contact LLB	Contact LLU	Low torque LLH
<b>Configuration</b>				

## Angular contact ball bearings

The line that unites point of contact of the inner ring, ball and outer ring runs at a certain angle (contact angle) in the radial direction. Bearings are generally designed with three contact angles.

Angular contact ball bearings can support an axial load, but cannot be used by single bearing because of the contact angle. They must instead be used in pairs or in combinations.

Angular contact ball bearings include double row angular contact ball bearings for which the inner and outer rings are combined as a single unit. The contact angle of double row angular contact ball bearings is 25°.

There are also four-point contact bearings that can support an axial load in both directions by themselves. These bearings however require caution because problems such as excessive temperature rise and wearing could occur depending on the load conditions.

Table 1.3 Contact angle and symbol

Contact angle and contact angle symbol			
Contact angle	15°	30°	40°
Contact angle symbol	C	A <sup>1)</sup>	B

Note 1: Contact angle symbol has been abbreviated as "A".

Configuration				

Table 1.5 Combinations of duplex angular contact ball bearings

Type and symbol	Back-to-back duplex DB	Face-to-face duplex DF	Tandem duplex DT
Configuration			

## Cylindrical roller bearings

Uses rollers for rolling elements, and therefore has a high load capacity. The rollers are guided by the ribs of the inner or outer ring. The inner and outer rings can be separated to facilitate assembly, and both can be fit with shaft or housing tightly. If there is no ribs, either the inner or the outer ring can move freely in the axial direction. Cylindrical roller bearings are therefore ideal to be used as so-called "free side bearings" that absorb shaft expansion. In the case where there is a ribs, the bearing can bear a slight axial load between the end of the rollers and the ribs. Cylindrical roller bearings include the HT type which modifies the shape of roller end face and ribs for increasing axial load capacity. And the E type with a special internal design for enhancing radial load capacity. The E type is standardized for small-diameter sizes.

Table 1.6 shows the basic configuration for cylindrical roller bearings.

In addition to these, there are cylindrical roller bearings with multiple rows of rollers and the SL type of full complement roller bearing without cage.

Table 1.6 Types of cylindrical roller bearings

Type and Symbol	NU type N type	NJ type NF type	NUP type NH type (NJ+HJ)
Drawings	 NU type	 NJ type	 NUP type
	 N type	 NF type	 NH type

## Tapered roller bearings

Tapered roller bearings are designed so the inner/outer ring raceway and apex of the tapered rollers intersect at one point on the bearing centerline. By receiving combined load from inner and outer ring, the rollers are pushed against the inner ring rib and roll guided with rib.

Induced force is produced in the axial direction when a radial load is applied, so must be handled by using a pair of bearings. The inner ring with rollers and outer ring come apart, thus facilitating mounting with clearance or preload. Assembled clearance is however hard to manage and requires special attention. Tapered roller bearings are capable of supporting large loads in both the axial and radial directions.

NTN bearings with 4T-, ET-, T- and U attached to the name conform to ISO and JIS standards for sub-unit dimensions (nominal contact angle, nominal small end diameter of outer ring) and are internationally interchangeable.

NTN also has a line of case hardened steel bearings designed for longer life (ETA-, ET-, etc.). NTN tapered roller bearings also include bearings with two and four rows of tapered rollers for extra-heavy loads.

Fig. 1.3 Tapered roller bearings

## Spherical roller bearings

Equipped with an outer ring with a spherical raceway surface and an inner ring which holds two rows of barrel-shaped rolling elements, NTN spherical roller bearings are able to adjust center alignment to handle inclination of the axle or shaft.

There are variety of bearing types that differ according to internal design.

Spherical roller bearings include as type equipped with an inner ring with a tapered bore. The bearing can easily be mounted on a shaft by means of an adapter or withdrawal sleeve. The bearing is capable of supporting heavy loads, and is therefore often used in industrial machinery. When heavy axial load is applied to the bearing, the load on rollers of another row is disappeared, and can cause problems. Attention must therefore be paid to operating conditions.

Table 1.7 Types of spherical roller bearings

Type	Standard (B type)	C type	213 type	E type
Configuration				

## Thrust bearings

There are many types of thrust bearings that differ according to shape of rolling element and application. Allowable rotational speed is generally low and special attention must be paid to lubrication.

In addition to the ones given below, there are various types of thrust bearings for special applications. For details, see the catalog devoted to the concerned type of bearing.

Table 1.8 Types of thrust bearings

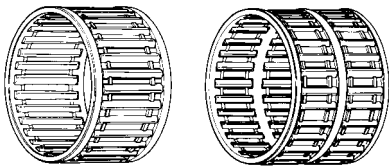

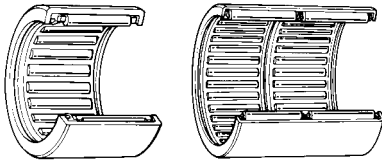

Type	Single direction thrust ball bearing	Needle roller thrust bearing
Configuration	   	  

## Needle roller bearings

Needle roller bearings use needle rollers as rolling elements. The needle rollers are a maximum of 5 mm in diameter and are 3 to 10 times as long as they are in diameter. Because the bearings use needle rollers as rolling elements, the cross-section is thin, but they have a high load capacity for their size. Because of the large number of rolling elements, the bearings have high rigidity and are ideally suited to wobbling or pivoting motion.

There is a profusion of types of needle roller bearings, and just a few of the most representative types are covered here. For details, see the catalog devoted to the concerned type of bearing.

Table 1.9 Main types of needle roller bearings

Type	Needle roller bearing with cage
Configuration	
	Solid type needle roller bearings
	
	Shell type needle roller bearings
	
Roller follower    Cam follower	
	

## Bearing unit

A unit comprised of a ball bearing inserted into various types of housings. The housing can be bolted onto machinery and the inner ring can be easily mounted on the shaft with a set screw.

This means the bearing unit can support rotating equipment without special design to allow for mounting. A variety of standardized housing shapes is available, including pillow and flange types. The outer diameter of the bearing is spherical just like the inner diameter of the housing, so it capable of aligning itself on the shaft.

For lubrication, grease is sealed inside the bearing, and particle generation is prevented by a double seal. For details, see the catalog devoted to the concerned type of bearing.

Fig. 1.4 Oil-lubricated bearing unit

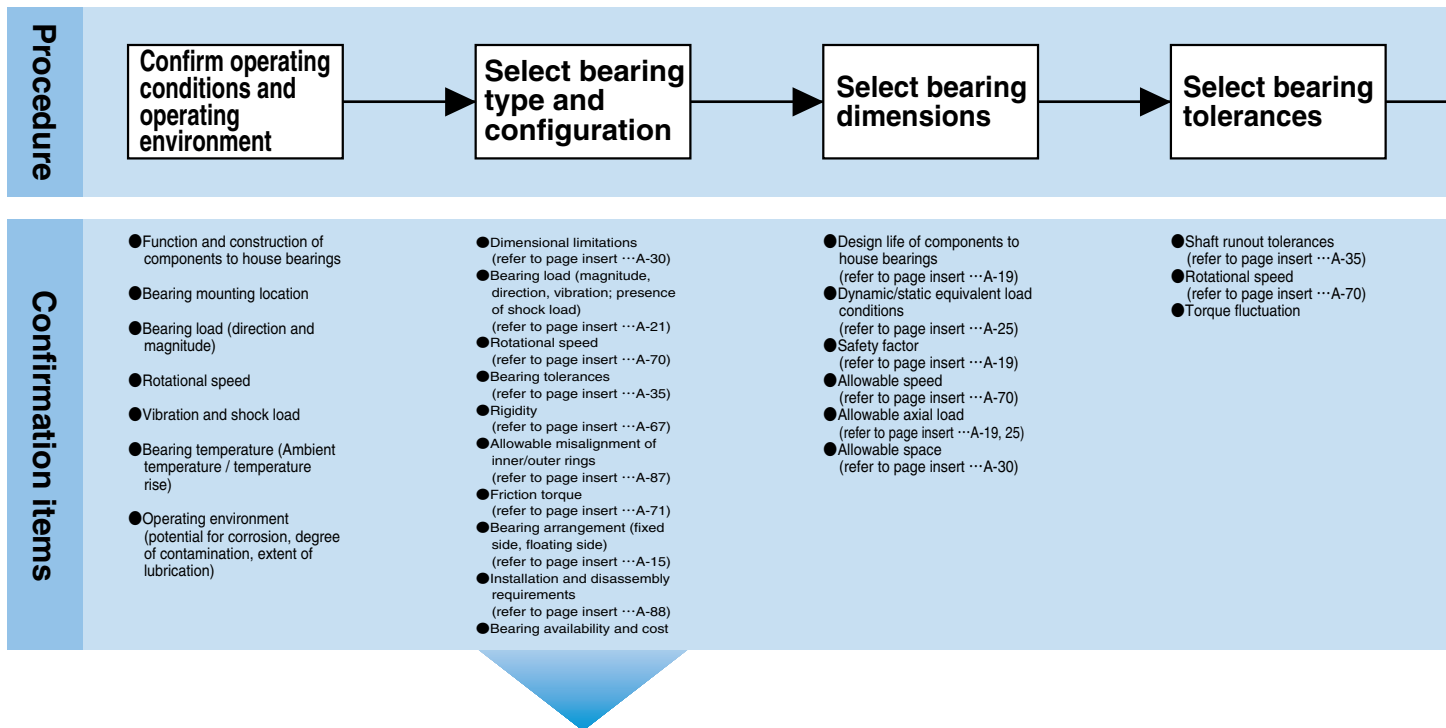

## 2. Bearing Selection

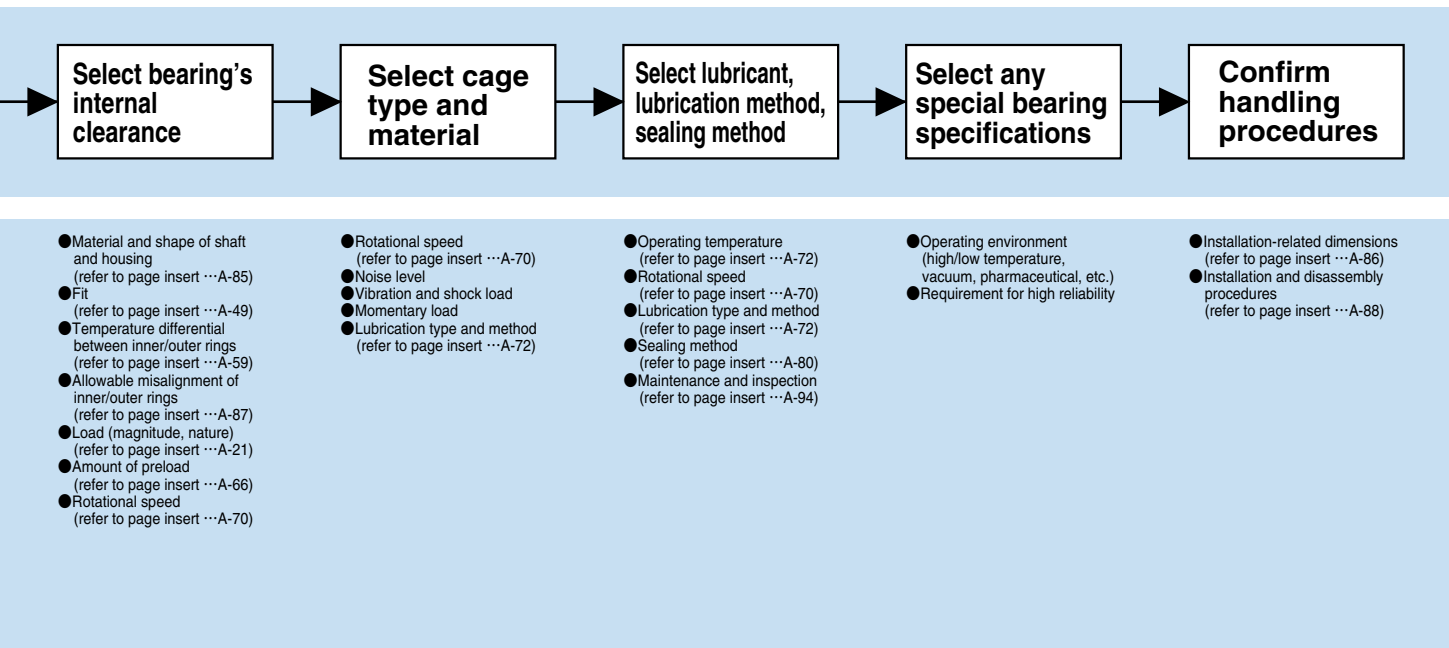

Rolling element bearings are available in a variety of types, configurations, and sizes. When selecting the correct bearing for your application, it is important to consider several factors, and analyse in various means.

A comparison of the performance characteristics for each bearing type is shown in **Table 2.1**. As a general guideline, the basic procedure for selecting the most appropriate bearing is shown in the following flow chart.

### 2.1 Bearing selection flow chart

Selection of bearing type and configuration	(1) Dimensional limitations	(2) Bearing load	(3) Rotational speed	(4) Bearing tolerances	(5) Rigidity
	<p>The allowable space for bearings is generally limited. In most cases, shaft diameter (or the bearing bore diameter) has been determined according to the machine's other design specifications. Therefore, bearing's type and dimensions are determined according to bearing bore diameters. For this reason all dimension tables are organized according to standard bore diameters. There is a wide range of standardized bearing types and dimensions: the right one for a particular application can usually be found in these tables.</p>	<p>The characteristics, magnitude, and direction of loads acting upon a bearing are extremely variable. In general, the basic load ratings shown in bearing dimension tables indicate their load capacity. However, in determining the appropriate bearing type, consideration must also be given to whether the acting load is a radial load only or combined radial and axial load, etc. When ball and roller bearings within the same dimension series are considered, the roller bearings have a larger load capacity and are also capable of withstanding greater vibration and shock loads.</p>	<p>The allowable speed of a bearing will differ depending upon bearing type, size, tolerances, cage type, load, lubricating conditions, and cooling conditions.</p> <p>The allowable speeds listed in the bearing tables for grease and oil lubrication are for normal tolerance NTN bearings. In general, deep groove ball bearings, angular contact ball bearings, and cylindrical roller bearings are most suitable for high speed applications.</p>	<p>The dimensional accuracy and operating tolerances of bearings are regulated by ISO and JIS standards. For equipment requiring high tolerance shaft runout or high speed operation, bearings with Class 5 tolerance or higher are recommended. Deep groove ball bearings, angular contact ball bearings, and cylindrical roller bearings are recommended for high rotational tolerances.</p>	<p>Elastic deformation occurs along the contact surfaces of a bearing's rolling elements and raceway surfaces under loading. With certain types of equipment it is necessary to reduce this deformation as much as</p>

possible. Roller bearings exhibit less elastic deformation than ball bearings. Furthermore, in some cases, bearings are given a load in advance (preloaded) to increase their rigidity. This procedure is commonly applied to deep groove ball bearings, angular contact ball bearings, and tapered roller bearings.

### (6) Misalignment of inner and outer rings

Shaft flexure, variations in shaft or housing accuracy, and fitting errors, result in a certain degree of misalignment between the bearing's inner and outer rings. In cases where the degree of misalignment is relatively large, self-aligning ball bearings, spherical roller bearings, or bearing units with self-aligning properties are the most appropriate choices.

(Refer to **Fig. 2.1**)

### (7) Noise and torque levels

Rolling bearings are manufactured and processed according to high precision standards, and therefore generally produce only slight amounts of noise and torque. For applications requiring particularly low-noise or low-torque operation, deep groove ball bearings and cylindrical roller bearings are most appropriate.

### (8) Installation and disassembly

Some applications require frequent disassembly and reassembly to enable periodic inspections and repairs. For such applications, bearings with separable inner/outer rings, such as cylindrical roller bearings, needle roller bearings, and tapered roller bearings are most appropriate. Incorporation of adapter sleeves simplifies the installation and disassembly of self-aligning ball bearings and spherical roller bearings with tapered bores.

Fig. 2.1

- ④ ○ Indicates both inner ring and outer ring are detachable.
- ⑤ ○ Indicates inner ring with tapered bore is possible.

## 2.3 Selection of bearing arrangement

Shafts or axles are generally supported by a pair of bearings in the axial and radial directions. The bearing which prevents axial movement of the shaft relative to the housing is called the **"fixed side bearing"** and the bearing which allows axial movement relatively is called the **"floating-side bearing"**. This allows for expansion and contraction of the shaft due to temperature variation and enables error in bearing mounting clearance to be absorbed.

The **fixed side bearing** is able to support radial and axial loads. A bearing which can fix axial movement in both directions should therefore be selected. A **floating-side bearing** that allows movement in the axial direction while supporting a radial load is desirable. Movement in the axial direction occurs on the raceway surface for bearings with separable inner and outer rings such as

cylindrical roller bearings, and occurs on the fitting surface for those which are not separable, such as deep groove ball bearings.

In applications with short distances between bearings, shaft expansion and contraction due to temperature fluctuations is slight, therefore the same type of bearing may be used for both the fixed-side and floating-side bearing. In such cases it is common to use a set of matching bearings, such as angular contact ball bearings, to guide and support the shaft in one axial direction only.

**Table 2.2 (1)** shows typical bearing arrangements where the bearing type differs on the fixed side and floating side. **Table 2.2 (2)** shows some common bearing arrangements where no distinction is made between the fixed side and floating side. Vertical shaft bearing arrangements are shown in **Table 2.2 (3)**.

**Table 2.2 (1) Bearing arrangement (distinction between fixed and floating-side)**

### 3. Load Rating and Life

#### 3.1 Bearing life

Even in bearings operating under normal conditions, the surfaces of the raceway and rolling elements are constantly being subjected to repeated compressive stresses which causes flaking of these surfaces to occur. This flaking is due to material fatigue and will eventually cause the bearings to fail. The effective life of a bearing is usually defined in terms of the total number of revolutions a bearing can undergo before flaking of either the raceway surface or the rolling element surfaces occurs.

Other causes of bearing failure are often attributed to problems such as seizing, abrasions, cracking, chipping, scuffing, rust, etc. However, these so called "causes" of bearing failure are usually themselves caused by improper installation, insufficient or improper lubrication, faulty sealing or inaccurate bearing selection. Since the above mentioned "causes" of bearing failure can be avoided by taking the proper precautions, and are not simply caused by material fatigue, they are considered separately from the flaking aspect.

#### 3.2 Basic rating life and basic dynamic load rating

A group of seemingly identical bearings when subjected to identical load and operating conditions will exhibit a wide diversity in their durability.

This "life" disparity can be accounted for by the difference in the fatigue of the bearing material itself. This disparity is considered statistically when calculating bearing life, and the basic rating life is defined as follows.

The basic rating life is based on a 90% statistical model which is expressed as the total number of revolutions 90% of the bearings in an identical group of bearings subjected to identical operating conditions will attain or surpass before flaking due to material fatigue occurs. For bearings operating at fixed constant speeds, the basic rating life (90% reliability) is expressed in the total number of hours of operation.

Basic dynamic load rating expresses a rolling bearing's capacity to support a dynamic load. The basic dynamic load rating is the load under which the basic rating life of the bearing is 1 million revolutions. This is expressed as pure radial load for radial bearings and pure axial load for thrust bearings. These are referred to as "basic dynamic load rating ( $C_r$ )" and "basic dynamic axial load rating ( $C_a$ ).". The basic dynamic load ratings given in the bearing tables of this catalog are for bearings constructed of NTN standard bearing materials, using standard manufacturing techniques.

The relationship between the basic rating life, the basic dynamic load rating and the bearing load is given in formula.

For ball bearings:  $L_{10} = \left(\frac{C}{P}\right)^3 \dots\dots\dots(3.1)$

For roller bearings:  $L_{10} = \left(\frac{C}{P}\right)^{10/3} \dots\dots\dots(3.2)$

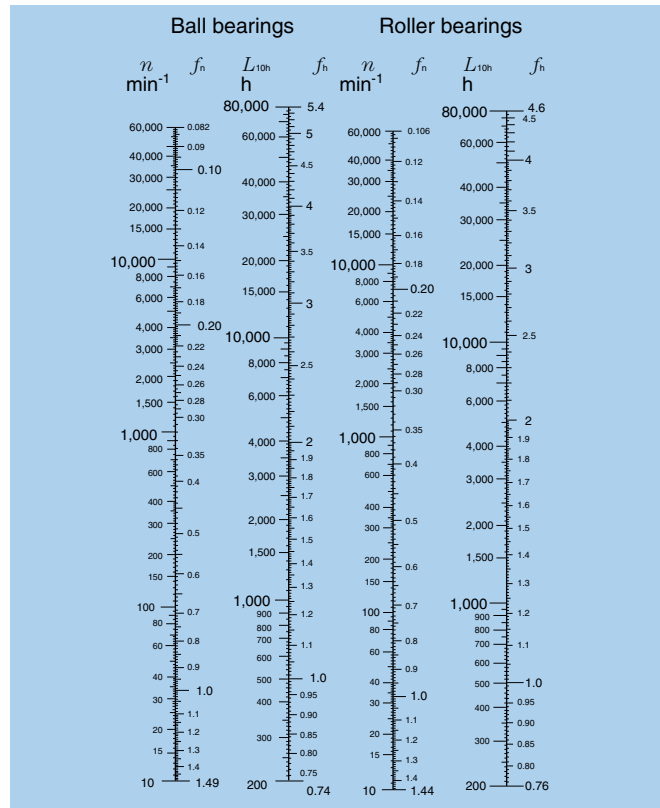

where,

- $L_{10}$  : Basic rating life  $10^6$  revolutions
- $C$  : Basic dynamic load rating, N {kgf}  
( $C_r$ : radial bearings,  $C_a$ : thrust bearings)
- $P$  : Equivalent dynamic load, N {kgf}  
( $P_r$ : radial bearings,  $P_a$ : thrust bearings)
- $n$  : Rotational speed,  $\text{min}^{-1}$

The relationship between Rotational speed  $n$  and speed factor  $f_n$  as well as the relation between the basic rating life  $L_{10h}$  and the life factor  $f_h$  is shown in **Table 3.1** and **Fig. 3.1**.

**Table 3.1 Correlation of bearing basic rating life, life factor, and speed factor**

Classification	Ball bearing	Roller bearing
Basic rating life $L_{10h}$ h	$\frac{10^6}{60n} \left(\frac{C}{P}\right)^3 = 500 f_h^3$	$\frac{10^6}{60n} \left(\frac{C}{P}\right)^{10/3} = 500 f_h^{10/3}$
Life factor $f_h$	$f_n \frac{C}{P}$	$f_n \frac{C}{P}$
Speed factor $f_n$	$\left(\frac{33.3}{n}\right)^{1/3}$	$\left(\frac{33.3}{n}\right)^{3/10}$

**Fig. 3.1 Bearing life rating scale**

When several bearings are incorporated in machines or equipment as complete units, all the bearings in the unit are considered as a whole when computing bearing life (see formula 3.3).

$$L = \frac{1}{\left(\frac{1}{L_1^e} + \frac{1}{L_2^e} + \dots + \frac{1}{L_n^e}\right)^{1/e}} \dots\dots\dots (3.3)$$

where,

$L$  : Total basic rating life of entire unit, h

$L_1, L_2 \dots L_n$ : Basic rating life of individual bearings, 1, 2,  $\dots n$ , h

$e = 10/9$ .....For ball bearings

$e = 9/8$ .....For roller bearings

When the load conditions vary at regular intervals, the life can be given by formula (3.4).

$$L_m = \left(\frac{\Phi_1}{L_1} + \frac{\Phi_2}{L_2} + \dots + \frac{\Phi_j}{L_j}\right)^{-1} \dots\dots\dots (3.4)$$

where,

$L_m$  : Total life of bearing

$\Phi_j$  : Frequency of individual load conditions  
( $\sum \Phi_j = 1$ )

$L_j$  : Life under individual conditions

If equivalent load  $P$  and rotational speed  $n$  are operating conditions of the bearing, basic rated dynamic load  $C$  that satisfies required life of the bearing is determined using **Table 3.1** and formula (3.5). Bearings that satisfy the required  $C$  can be selected from the bearing dimensions table provided in the catalog.

$$C = P \frac{f_h}{f_n} \dots\dots\dots (3.5)$$

### 3.3 Adjusted rating life

The basic bearing rating life (90% reliability factor) can be calculated through the formulas mentioned earlier in Section 3.2. However, in some applications a bearing life factor of over 90% reliability may be required. To meet these requirements, bearing life can be lengthened by the use of specially improved bearing materials or manufacturing process. Bearing life is also sometimes affected by operating conditions such as lubrication, temperature and rotational speed.

Basic rating life adjusted to compensate for this is called "adjusted rating life," and is determined using formula (3.6).

$$L_{na} = a_1 \cdot a_2 \cdot a_3 L_{10} \dots\dots (3.6)$$

where,

$L_{na}$  : Adjusted rating life in millions of revolutions ( $10^6$ )

$a_1$  : Reliability factor

$a_2$  : Bearing characteristics factor

$a_3$  : Operating conditions factor

#### 3.3.1 Reliability factor $a_1$

The value of reliability factor  $a_1$  is provided in **Table 3.2** for reliability of 90% or greater.

#### 3.3.2 Bearing characteristics factor $a_2$

Bearing characteristics concerning life vary according to bearing material, quality of material and if using special manufacturing process. In this case, life is adjusted using bearing characteristics factor  $a_2$ .

The basic dynamic load ratings listed in the catalog are based on NTN's standard material and process, therefore, the adjustment factor  $a_2 = 1$ .  $a_2 > 1$  may be used for specially enhanced materials and manufacturing methods. If this applies, consult with NTN Engineering.

Dimensions change significantly if bearings made of high carbon chrome bearing steel with conventional heat treatment are used at temperatures in excess of 120°C for an extended period of time. NTN Engineering therefore offers a bearing for high-temperature applications specially treated to stabilize dimensions at the maximum operating temperature (TS treatment). The treatment however makes the bearing softer and affects life of the bearing. Life is adjusted by multiplying by the values given in **Table 3.3**.

**Table 3.2 Reliability factor  $a_1$**

Reliability %	$L_n$	Reliability factor $a_1$
90	$L_{10}$	1.00
95	$L_5$	0.62
96	$L_4$	0.53
97	$L_3$	0.44
98	$L_2$	0.33
99	$L_1$	0.21

**Table 3.3 Treatment for stabilizing dimensions**

Symbol	Max. operating temperature (C°)	Bearing characteristics factor $a_2$
TS2	160	1.00
TS3	200	0.73
TS4	250	0.48

#### 3.3.3 Operating conditions factor $a_3$

Operating conditions factor  $a_3$  is used to compensate for when lubrication condition worsens due to rise in temperature or rotational speed, lubricant deteriorates, or becomes contaminated with foreign matter.

Generally speaking, when lubricating conditions are satisfactory, the  $a_3$  factor has a value of one; and when lubricating conditions are exceptionally favorable, and all other operating conditions are normal,  $a_3$  can have a value greater than one.  $a_3$  is however less than 1 in the following cases:

- Dynamic viscosity of lubricating oil is too low for bearing operating temperature  
(13 mm<sup>2</sup>/s or less for ball bearings, 20 mm<sup>2</sup>/s for roller bearings)
- Rotational speed is particularly low  
(If sum of rotational speed  $n$  min<sup>-1</sup> and rolling element pitch diameter  $D_{pw}$  mm is  $D_{pw} \cdot n < 10,000$ )
- Bearing operating temperature is too high  
If bearing operating temperature is too high, the raceway becomes softened, thereby shortening life. Life is adjusted by multiplying by the values given in **Fig. 3.2** as the operating condition factor according to operating temperature. This however does not apply to bearings that have been treated to stabilize dimensions.
- Lubricant contaminated with foreign matter or moisture  
If using special operating condition, consult with NTN Engineering. Even if  $a_2 > 1$  is used for specially bearings made of enhanced materials or produced by special manufacturing methods,  $a_2 \times a_3 < 1$  is used if lubricating conditions are not favorable.

When a super heavy load is applied, harmful plastic distortion could be produced on the contact surfaces of the rolling elements and raceway. The formulae for determining basic rating life (3.1, 3.2, and 3.6) do not apply if  $P_r$  exceeds either  $C_{or}$  (Basic static load rating) or  $0.5 C_r$  for radial bearings, or if  $P_a$  exceeds  $0.5 C_a$  for thrust bearings.

### 3.4 Machine applications and requisite life

When selecting a bearing, it is essential that the requisite life of the bearing be established in relation to the operating conditions. The requisite life of the bearing is usually determined by the type of machine in which the bearing will be used, and duration of service and operational reliability requirements. A general guide to these requisite life criteria is shown in **Table 3.4**. When determining bearing size, the fatigue life of the bearing is an important factor; however, besides bearing life, the strength and rigidity of the shaft and housing must also be taken into consideration.

### 3.5 Basic static load rating

When stationary rolling bearings are subjected to static loads, they suffer from partial permanent deformation of the contact surfaces at the contact point between the rolling elements and the raceway. The amount of deformity increases as the load increases, and if this increase in load exceeds certain limits, the subsequent smooth operation of the bearings is impaired.

It has been found through experience that a permanent deformity of 0.0001 times the diameter of the rolling element, occurring at the most heavily stressed contact point between the raceway and the rolling elements, can be tolerated without any impairment in running efficiency.

Fig. 3.2 Operating conditions factor according to operating temperature

Table 3.4 Machine application and requisite life (reference)

Service classification	Machine application and requisite life (reference) $L_{10h}$ × 10 <sup>3</sup> h

Machines in constant use over 8 hours a day		<ul style="list-style-type: none"> <li>● Rolling mills</li> <li>● Escalators</li> <li>● Conveyors</li> <li>● Centrifuges</li> </ul>	<ul style="list-style-type: none"> <li>● Railway vehicle axles</li> <li>● Air conditioners</li> <li>● Large motors</li> <li>● Compressor pumps</li> </ul>	<ul style="list-style-type: none"> <li>● Locomotive axles</li> <li>● Traction motors</li> <li>● Mine hoists</li> <li>● Pressed flywheels</li> </ul>	<ul style="list-style-type: none"> <li>● Papermaking machines</li> <li>● Propulsion equipment for marine vessels</li> </ul>
24 hour continuous operation, non-interruptable					<ul style="list-style-type: none"> <li>● Water supply equipment</li> <li>● Mine drain pumps/ventilators</li> <li>● Power generating equipment</li> </ul>

The basic static load rating refers to a fixed static load limit at which a specified amount of permanent deformation occurs. It applies to pure radial loads for radial bearings and to pure axial loads for thrust bearings. The maximum applied load values for contact stress occurring at the rolling element and raceway contact points are given below.

For ball bearings	4,200 MPa {428kgf/mm <sup>2</sup> }
For self-aligning ball bearings	4,600 MPa {469kgf/mm <sup>2</sup> }
For roller bearings	4,000 MPa {408kgf/mm <sup>2</sup> }

Referred to as "basic static radial load rating" for radial bearings and "basic static axial load rating" for thrust bearings, basic static load rating is expressed as  $C_{or}$  or  $C_{oa}$  respectively and is provided in the bearing dimensions table.

### 3.6 Allowable static equivalent load

Generally the static equivalent load which can be permitted (See page A-25) is limited by the basic static rating load as stated in **Section 3.5**. However, depending on requirements regarding friction and smooth operation, these limits may be greater or lesser than the basic static rating load.

This is generally determined by taking the safety factor  $S_0$  given in **Table 3.5** and formula (3.7) into account.

$$S_0 = C_0 / P_0 \dots (3.7)$$

where,

- $S_0$  : Safety factor
- $C_0$  : Basic static load rating, N {kgf}  
(radial bearings:  $C_{or}$ , thrust bearings:  $C_{oa}$ )
- $P_0$  : Static equivalent load, N {kgf}  
(radial:  $P_{or}$ , thrust:  $C_{oa}$ )

**Table 3.5 Minimum safety factor values  $S_0$**

Operating conditions	Ball bearings	Roller bearings
High rotational accuracy demand	2	3
Normal rotating accuracy demand (Universal application)	1	1.5
Slight rotational accuracy deterioration permitted (Low speed, heavy loading, etc.)	0.5	1

- Note 1: For spherical thrust roller bearings, min.  $S_0$  value=4.  
 2: For shell needle roller bearings, min.  $S_0$  value=3.  
 3: When vibration and/or shock loads are present, a load factor based on the shock load needs to be included in the  $P_0$  max value.  
 4: If a large axial load is applied to deep groove ball bearings or angular ball bearings, the contact oval may exceed the raceway surface. For more information, please contact NTN Engineering.

## 4. Bearing Load Calculation

To compute bearing loads, the forces which act on the shaft being supported by the bearing must be determined. Loads which act on the shaft and its related parts include dead load of the rotator, load produced when the machine performs work, and load produced by transmission of dynamic force. These can theoretically be mathematically calculated, but calculation is difficult in many cases.

A method of calculating loads that act upon shafts that convey dynamic force, which is the primary application of bearings, is provided herein.

### 4.1 Load acting on shafts

#### 4.1.1 Load factor

There are many instances where the actual operational shaft load is much greater than the theoretically calculated load, due to machine vibration and/or shock. This actual shaft load can be found by using formula (4.1).

$$K = f_w \cdot K_c \quad \dots\dots (4.1)$$

where,

$K$  : Actual shaft load N {kgf}

$f_w$  : Load factor (Table 4.1)

$K_c$  : Theoretically calculated value N {kgf}

Table 4.1 Load factor  $f_w$

Amount of shock	$f_w$	Application
Very little or no shock	1.0~1.2	Electric machines, machine tools, measuring instruments.
Light shock	1.2~1.5	Railway vehicles, automobiles, rolling mills, metal working machines, paper making machines, printing machines, aircraft, textile machines, electrical units, office machines.
Heavy shock	1.5~3.0	Crushers, agricultural equipment, construction equipment, cranes.

#### 4.1.2 Gear load

The loads operating on gears can be divided into three main types according to the direction in which the load is applied; i.e. tangential ( $K_t$ ), radial ( $K_s$ ), and axial ( $K_a$ ). The magnitude and direction of these loads differ according to the types of gears involved. The load calculation methods given herein are for two general-use gear and shaft arrangements: parallel shaft gears, and cross shaft gears.

##### (1) Loads acting on parallel shaft gears

The forces acting on spur gears and helical gears are depicted in Figs. 4.1, 4.2, and 4.3. The load magnitude can be found by using or formulas (4.2), through (4.5).

$$\left. \begin{aligned} K_t &= \frac{19.1 \times 10^6 \cdot H}{D_p \cdot n} \quad \text{N} \\ &= \frac{1.95 \times 10^6 \cdot H}{D_p \cdot n} \quad \text{kgf} \end{aligned} \right\} \dots\dots (4.2)$$

$$K_s = K_t \cdot \tan \alpha \quad (\text{Spur gear}) \quad \dots\dots (4.3a)$$

$$= K_t \cdot \frac{\tan \alpha}{\cos \beta} \quad (\text{Helical gear}) \quad \dots\dots (4.3b)$$

$$K_r = \sqrt{K_t^2 + K_s^2} \quad \dots\dots (4.4)$$

$$K_a = K_t \cdot \tan \beta \quad (\text{Helical gear}) \quad \dots\dots (4.5)$$

where,

$K_t$  : Tangential gear load (tangential force), N {kgf}

$K_s$  : Radial gear load (separating force), N {kgf}

$K_r$  : Right angle shaft load (resultant force of tangential force and separating force), N {kgf}

$K_a$  : Parallel load on shaft, N {kgf}

$H$  : Transmission force, kW

$n$  : Rotational speed,  $\text{min}^{-1}$

$D_p$  : Gear pitch circle diameter, mm

$\alpha$  : Gear pressure angle, deg

$\beta$  : Gear helix angle, deg

Because the actual gear load also contains vibrations and shock loads as well, the theoretical load obtained by the above formula should also be adjusted by the gear factor  $f_z$  as shown in Table 4.2.

Fig. 4.1 Spur gear loads

Fig. 4.2 Helical gear loads

Fig. 4.3 Radial resultant forces

**Table 4.2 Gear factor  $f_z$**

Gear type	$f_z$
Precision ground gears (Pitch and tooth profile errors of less than 0.02 mm)	1.05~1.1
Ordinary machined gears (Pitch and tooth profile errors of less than 0.1 mm)	1.1~1.3

**(2) Loads acting on cross shafts**

Gear loads acting on straight tooth bevel gears and spiral bevel gears on cross shafts are shown in **Figs. 4.4** and **4.5**. The calculation methods for these gear loads are shown in **Table 4.3**. Herein, to calculate gear loads for straight bevel gears, the helix angle  $\beta = 0$ .

The symbols and units used in **Table 4.3** are as follows:

- $K_t$  : Tangential gear load (tangential force), N {kgf}
- $K_s$  : Radial gear load (separating force), N {kgf}
- $K_a$  : Parallel shaft load (axial load), N {kgf}
- $H$  : Transmission force, kW
- $n$  : Rotational speed,  $\text{min}^{-1}$
- $D_{pm}$  : Mean pitch circle diameter, mm
- $\alpha$  : Gear pressure angle, deg
- $\beta$  : Helix angle, deg
- $\delta$  : Pitch cone angle, deg

Because the two shafts intersect, the relationship of pinion and gear load is as follows:

$$K_{sp} = K_{ag} \dots \dots \dots (4.6)$$

$$K_{ap} = K_{sg} \dots \dots \dots (4.7)$$

where,

- $K_{sp}, K_{sg}$  : Pinion and gear separating force, N {kgf}
- $K_{ap}, K_{ag}$  : Pinion and gear axial load, N {kgf}

For spiral bevel gears, the direction of the load varies depending on the direction of the helix angle, the direction of rotation, and which side is the driving side or the driven side. The directions for the separating force ( $K_s$ ) and axial load ( $K_a$ ) shown in **Fig. 4.5** are positive directions. The direction of rotation and the helix angle direction are defined as viewed from the large end of the gear. The gear rotation direction in **Fig. 4.5** is assumed to be clockwise (right).

**Fig. 4.4 Loads on bevel gears**

**Fig. 4.5 Bevel gear diagram**

**Table 4.3 Loads acting on bevel gears**

Types of load	Rotation direction	Clockwise	Counter clockwise	Clockwise	Counter clockwise
	Helix direction	Right	Left	Left	Right
Tangential load (tangential force) $K_t$	$K_t = \frac{19.1 \times 10^6 \cdot H}{D_{pm} \cdot n}, \left\{ \frac{1.95 \times 10^6 \cdot H}{D_{pm} \cdot n} \right\}$				
Radial load (separation force) $K_s$	Driving side	$K_s = K_t \left[ \tan \alpha \frac{\cos \delta}{\cos \beta} + \tan \beta \sin \delta \right]$		$K_s = K_t \left[ \tan \alpha \frac{\cos \delta}{\cos \beta} - \tan \beta \sin \delta \right]$	
	Driven side	$K_s = K_t \left[ \tan \alpha \frac{\cos \delta}{\cos \beta} - \tan \beta \sin \delta \right]$		$K_s = K_t \left[ \tan \alpha \frac{\cos \delta}{\cos \beta} + \tan \beta \sin \delta \right]$	
Parallel load on gear shaft (axial load) $K_a$	Driving side	$K_a = K_t \left[ \tan \alpha \frac{\sin \delta}{\cos \beta} - \tan \beta \cos \delta \right]$		$K_a = K_t \left[ \tan \alpha \frac{\sin \delta}{\cos \beta} + \tan \beta \cos \delta \right]$	
	Driven side	$K_a = K_t \left[ \tan \alpha \frac{\sin \delta}{\cos \beta} + \tan \beta \cos \delta \right]$		$K_a = K_t \left[ \tan \alpha \frac{\sin \delta}{\cos \beta} - \tan \beta \cos \delta \right]$	

### 4.1.3 Chain / belt shaft load

The tangential loads on sprockets or pulleys when power (load) is transmitted by means of chains or belts can be calculated by formula (4.8).

$$K_t = \frac{19.1 \times 10^6 \cdot H}{D_p \cdot n} \quad \text{N} \quad \dots\dots\dots (4.8)$$

$$= \frac{1.95 \times 10^6 \cdot H}{D_p \cdot n} \quad \text{kgf}$$

where,

- $K_t$  : Sprocket/pulley tangential load, N {kgf}
- $H$  : Transmitted force, kW
- $D_p$  : Sprocket/pulley pitch diameter, mm

For belt drives, an initial tension is applied to give sufficient constant operating tension on the belt and pulley. Taking this tension into account, the radial loads acting on the pulley are expressed by formula (4.9). For chain drives, the same formula can also be used if vibrations and shock loads are taken into consideration.

$$K_r = f_b \cdot K_t \dots (4.9)$$

where,

- $K_r$  : Sprocket or pulley radial load, N {kgf}
- $f_b$  : Chain or belt factor (Table 4.4)

Table 4.4 chain or belt factor  $f_b$

Chain or belt type	$f_b$
Chain (single)	1.2~1.5
V-belt	1.5~2.0
Timing belt	1.1~1.3
Flat belt (w / tension pulley)	2.5~3.0
Flat belt	3.0~4.0

Fig. 4.6 Chain / belt loads

### 4.2 Bearing load distribution

For shafting, the static tension is considered to be supported by the bearings, and any loads acting on the shafts are distributed to the bearings.

For example, in the gear shaft assembly depicted in Fig. 4.7, the applied bearing loads can be found by using formulas (4.10) and (4.11).

This example is a simple case, but in reality, many of the calculations are quite complicated.

$$F_{rA} = \frac{a+b}{b} F_I + \frac{d}{c+d} F_{II} \dots\dots\dots (4.10)$$

$$F_{rB} = -\frac{a}{b} F_I + \frac{c}{c+d} F_{II} \dots\dots\dots (4.11)$$

where,

- $F_{rA}$  : Radial load on bearing A, N {kgf}
- $F_{rB}$  : Radial load on bearing B, N {kgf}
- $F_I, F_{II}$  : Radial load on shaft, N {kgf}

If directions of radial load differ, the vector sum of each respective load must be determined.

Fig. 4.7

### 4.3 Mean load

The load on bearings used in machines under normal circumstances will, in many cases, fluctuate according to a fixed time period or planned operation schedule. The load on bearings operating under such conditions can be converted to a mean load ( $F_m$ ), this is a load which gives bearings the same life they would have under constant operating conditions.

#### (1) Fluctuating stepped load

The mean bearing load,  $F_m$ , for stepped loads is calculated from formula (4.12).  $F_1, F_2, \dots, F_n$  are the loads acting on the bearing;  $n_1, n_2, \dots, n_n$  and  $t_1, t_2, \dots, t_n$  are the bearing speeds and operating times respectively.

$$F_m = \left[ \frac{\sum (F_i^p n_i t_i)}{\sum (n_i t_i)} \right]^{1/p} \dots \dots \dots (4.12)$$

where:

- $p=3$  For ball bearings
- $p=10/3$  For roller bearings

Fig. 4.8 Stepped load

#### (2) Continuously fluctuating load

Where it is possible to express the function  $F(t)$  in terms of load cycle  $t_o$  and time  $t$ , the mean load is found by using formula (4.13).

$$F_m = \left[ \frac{1}{t_o} \int_0^{t_o} F(t)^p dt \right]^{1/p} \dots \dots \dots (4.13)$$

where:

- $p=3$  For ball bearings
- $p=10/3$  For roller bearings

Fig. 4.9 Load that fluctuated as function of time

#### (3) Linear fluctuating load

The mean load,  $F_m$ , can be approximated by formula (4.14).

$$F_m = \frac{F_{min} + 2F_{max}}{3} \dots (4.14)$$

Fig. 4.10 Linear fluctuating load

#### (4) Sinusoidal fluctuating load

The mean load,  $F_m$ , can be approximated by formulas (4.15) and (4.16).

case (a)  $F_m = 0.75 F_{max} \dots \dots \dots (4.15)$

case (b)  $F_m = 0.65 F_{max} \dots \dots \dots (4.16)$

Fig. 4.11 Sinusoidal variable load

## 4.4 Equivalent load

### 4.4.1 Dynamic equivalent load

When both dynamic radial loads and dynamic axial loads act on a bearing at the same time, the hypothetical load acting on the center of the bearing which gives the bearings the same life as if they had only a radial load or only an axial load is called the dynamic equivalent load.

For radial bearings, this load is expressed as pure radial load and is called the dynamic equivalent radial load. For thrust bearings, it is expressed as pure axial load, and is called the dynamic equivalent axial load.

#### (1) Dynamic equivalent radial load

The dynamic equivalent radial load is expressed by formula (4.17).

$$P_r = XF_r + YF_a \dots \dots \dots (4.17)$$

where,

- $P_r$  : Dynamic equivalent radial load, N {kgf}
- $F_r$  : Actual radial load, N {kgf}
- $F_a$  : Actual axial load, N {kgf}
- $X$  : Radial load factor
- $Y$  : Axial load factor

The values for  $X$  and  $Y$  are listed in the bearing tables.

#### (2) Dynamic equivalent axial load

As a rule, standard thrust bearings with a contact angle of  $90^\circ$  cannot carry radial loads. However, self-aligning thrust roller bearings can accept some radial load. The dynamic equivalent axial load for these bearings is given in formula (4.18).

$$P_a = F_a + 1.2F_r \dots \dots \dots (4.18)$$

where,

- $P_a$  : Dynamic equivalent axial load, N {kgf}
- $F_a$  : Actual axial load, N {kgf}
- $F_r$  : Actual radial load, N {kgf}

Provided that  $F_r / F_a \leq 0.55$  only.

### 4.4.2 Static equivalent load

The static equivalent load is a hypothetical load which would cause the same total permanent deformation at the most heavily stressed contact point between the rolling elements and the raceway as under actual load conditions; that is when both static radial loads and static axial loads are simultaneously applied to the bearing.

For radial bearings this hypothetical load refers to pure radial loads, and for thrust bearings it refers to pure centric axial loads. These loads are designated static equivalent radial loads and static equivalent axial loads respectively.

#### (1) Static equivalent radial load

For radial bearings the static equivalent radial load can be found by using formula (4.19) or (4.20). The greater of the two resultant values is always taken for  $P_{or}$ .

$$P_{or} = X_o F_r + Y_o F_a \dots \dots \dots (4.19)$$

$$P_{or} = F_r \dots \dots \dots (4.20)$$

where,

- $P_{or}$  : Static equivalent radial load, N {kgf}
- $F_r$  : Actual radial load, N {kgf}
- $F_a$  : Actual axial load, N {kgf}
- $X_o$  : Static radial load factor
- $Y_o$  : Static axial load factor

The values for  $X_o$  and  $Y_o$  are given in the respective bearing tables.

#### (2) Static equivalent axial load

For spherical thrust roller bearings the static equivalent axial load is expressed by formula (4.21).

$$P_{oa} = F_a + 2.7F_r \dots \dots \dots (4.21)$$

where,

- $P_{oa}$  : Static equivalent axial load, N {kgf}
- $F_a$  : Actual axial load, N {kgf}
- $F_r$  : Actual radial load, N {kgf}

Provided that  $F_r / F_a \leq 0.55$  only.

### 4.4.3 Load calculation for angular contact ball bearings and tapered roller bearings

For angular contact ball bearings and tapered roller bearings the pressure cone apex (load center) is located as shown in **Fig. 4.12**, and their values are listed in the bearing tables.

When radial loads act on these types of bearings the component force is induced in the axial direction. For this reason, these bearings are used in pairs. For load calculation this component force must be taken into consideration and is expressed by formula (4.22).

$$F_a = \frac{0.5F_r}{Y} \dots \dots \dots (4.22)$$

where,

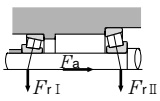

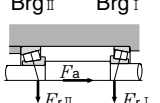

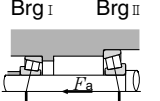

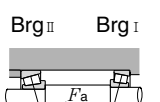

- $F_a$ : Axial component force, N {kgf}
- $F_r$ : Radial load, N {kgf}
- $Y$ : Axial load factor

The dynamic equivalent radial loads for these bearing pairs are given in **Table 4.5**.

**Fig. 4.12 Pressure cone apex and axial component force**

Table 4.5 Bearing arrangement and dynamic equivalent load

Bearing arrangement	Load condition	Axial load
Rear 	$\frac{0.5F_{rI}}{Y_I} \leq \frac{0.5F_{rII}}{Y_{II}} + F_a$	$F_{aI} = \frac{0.5F_{rII}}{Y_{II}} + F_a$
Front 		$F_{aII} = \frac{0.5F_{rI}}{Y_I} - F_a$
Rear 	$\frac{0.5F_{rII}}{Y_{II}} \leq \frac{0.5F_{rI}}{Y_I} + F_a$	$F_{aII} = \frac{0.5F_{rI}}{Y_I} + F_a$
Front 		$F_{aI} = \frac{0.5F_{rII}}{Y_{II}} - F_a$

Note 1: Applies when preload is zero.

2: Radial forces in the opposite direction to the arrow in the above illustration are also regarded as positive.

3: Dynamic equivalent radial load is calculated by using the table on the right of the size table of the bearing after axial load is obtained for  $X$  and  $Y$  factor.

## 4.5 Bearing rating life and load calculation examples

In the examples given in this section, for the purpose of calculation, all hypothetical load factors as well as all calculated load factors may be presumed to be included in the resultant load values.

### (Example 1)

What is the rating life in hours of operation ( $L_{10h}$ ) for deep groove ball bearing **6208** operating at rotational speed  $n = 650 \text{ min}^{-1}$ , with a radial load  $F_r$  of 3.2 kN {326 kgf} ?

From formula (4.17) the dynamic equivalent radial load:

$$P_r = F_r = 3.2 \text{ kN } \{326 \text{ kgf}\}$$

Basic dynamic load rating  $C_r$  for bearing 6208 given on page B-12 is 29.1 kN {2970 kgf}, ball bearing speed factor  $f_n$  relative to rotational speed  $n = 650 \text{ min}^{-1}$  from **Fig. 3.1** is  $f_n = 0.37$ . Thus life factor  $f_h$  from formula (3.5) is:

$$f_h = f_n \frac{C_r}{P_r} = 0.37 \times \frac{29.1}{3.2} = 3.36$$

Therefore, with  $f_h = 3.36$  from **Fig. 3.1** the rated life,  $L_{10h}$ , is approximately 19,000 hours.

### (Example 2)

What is the life rating  $L_{10h}$  for the same bearing and conditions as in **Example 1**, but with an additional axial load  $F_a$  of 1.8 kN {184 kgf} ?

To find the dynamic equivalent radial load value for  $P_r$ , the radial load factor  $X$  and axial load factor  $Y$  are used. Basic static load rating  $C_{or}$  for bearing 6208 given on page B-12 is 17.8 kN {1820 kgf} and  $f_o$  is 14.0. Therefore:

$$\frac{f_o \cdot F_a}{C_{or}} = \frac{14 \times 1.8}{17.8} = 1.42$$

Calculating by the proportional interpolation method given on page B-13,  $e = 0.30$ .

For the operating radial load and axial load:

$$\frac{F_a}{F_r} = \frac{1.8}{3.2} = 0.56 > e = 0.30$$

From page B-13  $X = 0.56$  and  $Y = 1.44$ , and from formula (4.17) the equivalent radial load,  $P_r$ , is:

$$\begin{aligned} P_r &= XF_r + YF_a = 0.56 \times 3.2 + 1.43 \times 1.8 \\ &= 4.38 \text{ kN } \{447 \text{ kgf}\} \end{aligned}$$

From **Fig. 3.1** and formula (3.1) the life factor,  $f_h$ , is:

$$f_h = f_n \frac{C_r}{P_r} = 0.37 \times \frac{29.1}{4.38} = 2.46$$

Therefore, with life factor  $f_h = 2.46$ , from **Fig. 3.1** the rated life,  $L_{10h}$ , is approximately 7,500 hours.

### (Example 3)

Determine the optimum model number for a cylindrical roller bearing operating at the rotational speed  $n = 450 \text{ min}^{-1}$ , with a radial load  $F_r$  of 200 kN {20,400 kgf}, and which must have a life ( $L_{10h}$ ) of over 20,000 hours.

From **Fig. 3.1** the life factor  $f_h = 3.02$  ( $L_{10h}$  at 20,000), and the speed factor  $f_n = 0.46$  ( $n = 450 \text{ min}^{-1}$ ). To find the required basic dynamic load rating,  $C_r$ , formula (3.1) is used.

$$\begin{aligned} C_r &= \frac{f_h}{f_n} P_r = \frac{3.02}{0.46} \times 200 \\ &= 1,313 \text{ kN } \{134,000 \text{ kgf}\} \end{aligned}$$

From page B-92, the smallest bearing that fulfills all the requirements is **NU2336** ( $C_r = 1,380 \text{ kN } \{141,000 \text{ kgf}\}$ ).

**(Example 4)**

The spur gear shown in **Fig. 4.13** (pitch diameter  $D_p = 150$  mm, pressure angle  $\alpha = 20^\circ$ ) is supported by a pair of tapered roller bearings, 4T-32206 ( $C_r = 54.5$  kN {5,600 kgf}) and 4T-32205 ( $C_r = 42$  kN {4300 kgf}). Find rating life for each bearing when gear transfer power  $H = 150$  kW and rotational speed  $n = 2,000$  min<sup>-1</sup>.

**Fig. 4.13** Spur gear diagram

The gear load from formulas (4.2), (4.3a) and (4.4) is:

$$K_t = \frac{19.1 \times 10^6 \cdot H}{D_p \cdot n} = \frac{19,100 \times 150}{150 \times 2,000} = 9.55 \text{ kN } \{974 \text{ kgf}\}$$

$$K_s = K_t \cdot \tan \alpha = 9.55 \times \tan 20^\circ = 3.48 \text{ kN } \{355 \text{ kgf}\}$$

$$K_r = \sqrt{K_t^2 + K_s^2} = \sqrt{9.55^2 + 3.48^2} = 10.16 \text{ kN } \{1,040 \text{ kgf}\}$$

The radial loads for bearings I and II are:

$$F_{rI} = \frac{100}{170} K_r = \frac{100}{170} \times 10.16 = 5.98 \text{ kN } \{610 \text{ kgf}\}$$

$$F_{rII} = \frac{70}{170} K_r = \frac{70}{170} \times 10.16 = 4.18 \text{ kN } \{426 \text{ kgf}\}$$

$$\frac{0.5F_{rI}}{Y_I} = 1.87 > \frac{0.5F_{rII}}{Y_{II}} = 1.25$$

The axial loads for bearings I and II are:

$$F_{aI} = 0 \text{ kN } \{0 \text{ kgf}\}$$

$$F_{aII} = \frac{0.5F_{rI}}{Y_I} = \frac{0.5 \times 5.98}{1.60} = 1.87 \text{ kN } \{191 \text{ kgf}\}$$

From page B-129, the equivalent radial load for bearing I is:

$$\frac{F_{aI}}{F_{rI}} = \frac{0}{5.98} = 0 < e = 0.37$$

$$P_{rI} = F_{rI} = 5.98 \text{ kN } \{610 \text{ kgf}\}$$

Equally, the equivalent radial load for bearing II is:

$$\frac{F_{aII}}{F_{rII}} = \frac{1.87}{4.18} = 0.45 < e = 0.36$$

$$P_{rII} = X F_{rII} + Y_{II} F_{aII} = 0.4 \times 4.18 + 1.67 \times 1.87 = 4.79 \text{ kN } \{489 \text{ kgf}\}$$

From formula (3.5) and **Fig. 3.1** the life factor,  $f_h$ , for each bearing is

$$f_{hI} = f_n \frac{C_{rI}}{P_{rI}} = 0.293 \times 54.5 / 5.98 = 2.67$$

$$f_{hII} = f_n \frac{C_{rII}}{P_{rII}} = 0.293 \times 42.0 / 4.79 = 2.57$$

Therefore:  $a_2 = 1.4$  (4T-tapered roller bearings shown in **B-130**)

$$L_{h1} = 13,200 \times a_2 = 13,200 \times 1.4 = 18,480 \text{ hour}$$

$$L_{h2} = 11,600 \times a_2 = 11,600 \times 1.4 = 16,240 \text{ hour}$$

The combined bearing life,  $L_h$ , from formula (3.3) is:

$$L_h = \frac{1}{\left[ \frac{1}{L_{h1}^e} + \frac{1}{L_{h2}^e} \right]^{1/e}}$$

$$= \frac{1}{\left[ \frac{1}{18,480^{9/8}} + \frac{1}{16,240^{9/8}} \right]^{8/9}}$$

$$= 9,330 \text{ hour}$$

**(Example 5)**

Find the mean load for spherical roller bearing **23932** ( $L_a = 320 \text{ kN}$  {33,000 kgf}) when operated under the fluctuating conditions shown in **Table 4.6**.

**Table 4.6**

Condition No. $i$	Operating time $\phi_i$ %	Radial load $F_{ri}$ kN { kgf }	Axial load $F_{ai}$ kN { kgf }	Revolution $n_i$ min <sup>-1</sup>
1	5	10 { 1020 }	2 { 204 }	1200
2	10	12 { 1220 }	4 { 408 }	1000
3	60	20 { 2040 }	6 { 612 }	800
4	15	25 { 2550 }	7 { 714 }	600
5	10	30 { 3060 }	10 { 1020 }	400

The equivalent radial load,  $P_r$ , for each operating condition is found by using formula (4.17) and shown in **Table 4.7**. Because all the values for  $F_{ri}$  and  $F_{ai}$  from the bearing tables are greater than  $F_a / F_r > e = 0.18$ ,  $X = 0.67$ ,  $Y_2 = 5.50$ .

$$P_{ri} = X F_{ri} + Y_2 F_{ai} = 0.67 F_{ri} + 5.50 F_{ai}$$

From formula (4.12) the mean load,  $F_m$ , is:

$$F_m = \left[ \frac{\sum (P_{ri}^{10/3} \cdot n_i \cdot \phi_i)}{\sum (n_i \cdot \phi_i)} \right]^{3/10} = 48.1 \text{ kN} \{ 4,906 \text{ kgf} \}$$

**Table 4.7**

Condition No. $i$	Equivalent radial load. $P_{ri}$ kN { kgf }
1	17.7 { 1805 }
2	30.0 { 3060 }
3	46.4 { 4733 }
4	55.3 { 5641 }
5	75.1 { 7660 }

**(Example 6)**

Find the threshold values for rating life time and allowable axial load when cylindrical roller bearing NUP312 is used under the following conditions: Provided that intermittent axial load and oil lubricant.

Radial load  $F_r = 10 \text{ kN}$  {1,020 kgf}

Rotational speed  $n = 2,000 \text{ min}^{-1}$

Radial load is:

$$P_r = F_r = 10 \text{ kN} \{ 1,020 \text{ kgf} \}$$

The speed factor of cylindrical roller bearing,  $f_n$ , at  $n = 2,000 \text{ min}^{-1}$ , from **Table 3.1**

$$f_n = \left[ \frac{33.3}{2,000} \right]^{3/10} = 0.293$$

The life factor,  $f_h$ , from formula (3.4)

$$f_h = 0.293 \times \frac{124}{10} = 3.63$$

Therefore the basic rated life,  $L_{10h}$ , from **Table 3.1**

$$L_{10h} = 500 \times 3.63^{10/3} \approx 37,000$$

And next, allowable axial load of cylindrical roller bearing is shown in page B-79.

In formula (1) on page B-79, based on NUP312 from Table 4 on page B-79,  $k = 0.065$ .

$$d_p = (60 + 130) / 2 = 95 \text{ mm}, n = 2,000 \text{ min}^{-1}$$

Take into consideration that intermittent axial load.

$$d_p \cdot n \times 10^4 = 19 \times 10^4$$

In **Fig. 1** on page B-79,  $d_p \cdot n = 19 \times 10^4$ . In the case of intermittent axial load, allowable surface pressure at the lip  $P_t = 40 \text{ MPa}$ .

Therefore the allowable axial load,  $P_t$ , following

$$P_z = 0.065 \times 60^2 \times 40 = 9,360 \text{ N} \{ 954 \text{ kgf} \}$$

Based on **Table 4** of page B-79, it is within the limits of  $F_{a \text{ max}} < 0.4 \times 10,000 = 4,000 \text{ N}$ . Therefore  $P_t < 4,000 \text{ N}$  {408 kgf}.

## 5. Boundary Dimensions and Bearing Number Codes

### 5.1 Boundary dimensions

A rolling bearing's major dimensions, known as "boundary dimensions," are shown in **Figs. 5.1 - 5.3**. To facilitate international bearing interchangeability and economical bearing production, bearing boundary dimensions have been standardized by the International Standards Organization (ISO). In Japan, rolling bearing boundary dimensions are regulated by Japanese Industrial Standards (JIS B 1512).

Those boundary dimensions which have been standardized include: bearing bore diameter, outside diameter, width/height, and chamfer dimensions - all important dimensions when considering the compatibility of shafts, bearings, and housings. However, as a general rule,

bearing internal construction dimensions are not covered by these dimensions.

For metric series rolling bearings there are 90 standardized bore diameters ( $d$ ) ranging in size from 0.6mm - 2,500mm.

Outer diameter dimensions ( $D$ ) for radial bearings with standardized bore diameter dimensions are covered in the "diameter series;" their corresponding width dimensions ( $B$ ) are covered in the "width series." For thrust bearings there is no width series; instead, these dimensions are covered in the "height series." The combination of all these series is known as the "dimension series." All series numbers are shown in **Table 5.1**.

Although many rolling bearing dimensions are standardized, and have been listed here for purposes of

**Fig. 5.1 Radial bearings (excluding tapered roller bearings)**

**Fig. 5.2 Tapered roller bearings**

**Fig. 5.3 Single direction thrust bearings**

**Table 5.1 Dimension series numbers**

	Dimension series				Reference diagram

**Fig. 5.5 Dimension series for tapered roller bearings**

**Fig. 5.6 Dimension series for thrust bearings (excluding diameter series 5)**

future standardization, there are many standard bearing dimensions which are not presently manufactured.

Boundary dimensions for radial bearings (excluding tapered roller bearings) are shown in the attached tables.

## 5.2 Bearing numbers

Rolling bearing part numbers indicate bearing type, dimensions, tolerances, internal construction, and other related specifications. Bearing numbers are comprised of a

"basic number" followed by "supplementary codes." The makeup and order of bearing numbers is shown in **Table 5.2**.

The basic number indicates general information about a bearing, such as its fundamental type, boundary dimensions, series number, bore diameter code and contact angle. The supplementary codes derive from prefixes and suffixes which indicate a bearing's tolerances, internal clearances, and related specifications.

① Codes in ( ) are not shown in nominal numbers.

Note: Please consult NTN Engineering concerning bearing series codes, and supplementary prefix/suffix codes not listed in the above table.

Supplementary suffix codes							
Internal modifications code	cage code	Seal / Shield code	External configuration code	Duplex arrangement code	Internal clearance /preload code	Tolerance code	Lubrication code
U: Internationally interchangeable tapered roller bearings	L1: High strength, machined brass cage	LLB: Synthetic rubber seal (non-contact type)	K: Tapered inner ring bore, standard taper ratio 1:12	DB: Back-to-back arrangement	C2: Internal clearance less than normal	P6: JIS Class 6	/2AS: Shell Alvania S2 grease
R: Non-internationally interchangeable tapered roller bearings	F1: Machined carbon steel cage	LLU: Synthetic rubber seal (contact type)	K30: Tapered inner ring bore, standard taper ratio 1:30	DF: Face-to-face arrangement	(CN): Normal clearance	P5: JIS Class 5	/3AS: Shell Alvania S3 grease
ST: Low torque tapered roller bearings	G1: High strength machined brass rivetless cage with square holes,	LLH: Synthetic rubber seal (low-torque type)	N: With snap ring groove	DT: Tandem arrangement	C3: Internal clearance greater than normal	P4: JIS Class 4	/8A: Shell Alvania EP2 grease
HT: High axial load use cylindrical roller bearings	G2: Pin type cage	ZZ: Steel shield	NR: With snap ring	D2: Two matched, paired bearings	C4: Internal clearance greater than C3	2: ABMA Class 2	/5K: MULTEMP SRL
J: Pressed steel cage	J: Pressed steel cage		D: With oil hole	G: Flush ground	C5: Internal clearance greater than C4	3: ABMA Class 3	/LX11: Barierta JFE552
T2: Plastic mold cage	T2: Plastic mold cage		D1: Lubrication hole/lubrication groove	+ $\alpha$ : Spacer ( $\alpha$ = spacer's standard width dimensions)	CM: Radial internal clearance for electric motor use	0: ABMA Class 0	/LP03: Thermosetting grease (grease for poly-lube bearings)
					/GL: Light preload	00: ABMA Class 00	
					/GN: Normal preload		
					/GM: Medium preload		
					/GH: Heavy preload		

## 6. Bearing Tolerances

### 6.1 Dimensional accuracy and running accuracy

Bearing “tolerances” or dimensional accuracy and running accuracy, are regulated by ISO and JIS B 1514 standards (rolling bearing tolerances). For dimensional accuracy, these standards prescribe the tolerances necessary when installing bearings on shafts or in housings. Running accuracy is defined as the allowable limits for bearing runout during operation.

#### Dimensional accuracy

Dimensional accuracy constitutes the acceptable values for bore diameter, outer diameter, assembled bearing width, and bore diameter uniformity as seen in chamfer dimensions, allowable inner ring tapered bore deviation and shape error. Also included are, average bore diameter variation, outer diameter variation, average outer diameter unevenness, as well as raceway width and height variation (for thrust bearings).

#### Running accuracy

Running accuracy constitutes the acceptable values for inner and outer ring radial runout and axial runout, inner ring side runout, and outer ring outer diameter runout.

Allowable rolling bearing tolerances have been established according to precision classes. Bearing precision is stipulated as JIS class 6, class 5, class 4, or class 2, with precision rising from ordinary precision indicated by class 0.

**Table 6.1** indicates which standards and precision classes are applicable to the major bearing types. **Table 6.2** shows a relative comparison between JIS B 1514 precision class standards and other standards. For greater detail on allowable limitations and values, refer to **Tables 6.3 - 6.8**. Allowable values for chamfer dimensions are shown in **Table 6.9**, and allowable limitations and values for radial bearing inner ring tapered bores are shown in **Table 6.10**.

**Table 6.1 Bearing types and applicable tolerance**

Bearing type		Applicable standard	Tolerance class					Tolerance table
Deep groove ball bearings		JIS B 1514 (ISO492)	class 0	class 6	class 5	class 4	class 2	<b>Table 6.3</b>
Angular contact ball bearings			class 0	class 6	class 5	class 4	class 2	
Self-aligning ball bearings			class 0	—	—	—	—	
Cylindrical roller bearings			class 0	class 6	class 5	class 4	class 2	
Needle roller bearings			class 0	class 6	class 5	class 4	—	
Spherical roller bearings			class 0	—	—	—	—

	Inch	ANSI/ABMA Std.19	class 4	class 2	class 3	class 0	class 00	<b>Table 6.5</b>
	J series	ANSI/ABMA Std.19.1	class K	class N	class C	class B	class A	<b>Table 6.6</b>
Thrust ball bearings		JIS B 1514 (ISO199)	class 0	class 6	class 5	class 4	—	<b>Table 6.7</b>
Spherical roller thrust bearings			class 0	—	—	—	—	<b>Table 6.8</b>

**Table 6.2 Comparison of tolerance classifications of national standards**

Standard	Applicable standard	Tolerance Class					Bearing Types
Japanese industrial standard (JIS)	JIS B 1514	Class 0,6X	Class 6	Class 5	Class 4	Class 2	All type
International Organization for Standardization (ISO)	ISO 492	Normal class Class 6X	Class 6	Class 5	Class 4	Class 2	Radial bearings
	ISO 199	Normal Class	Class 6	Class 5	Class 4	—	Thrust ball bearings
	ISO 578	Class 4	—	Class 3	Class 0	Class 00	Tapered roller bearings (Inch series)
	ISO 1224	—	—	Class 5A	Class 4A	—	Precision instrument bearings
Deutsches Institut für Normung (DIN)	DIN 620	P0	P6	P5	P4	P2	All type
American National Standards Institute (ANSI)	ANSI/ABMA Std.20 <sup>1</sup>	ABEC-1 RBEC-1	ABEC-3 RBEC-3	ABEC-5 RBEC-5	ABEC-7	ABEC-9	Radial bearings (Except tapered roller bearings)
American Bearing Manufacturer's Association (ABMA)	ANSI/ABMA Std.19.1	Class K	Class N	Class C	Class B	Class A	Tapered roller bearings (Metric series)
	ANSI/ABMA Std.19	Class 4	Class 2	Class 3	Class 0	Class 00	Tapered roller bearings (Inch series)

<sup>1</sup> "ABEC" is applied for ball bearings and "RBEC" for roller bearings.

Notes 1: JIS B 1514, ISO 492 and 199, and DIN 620 have the same specification level.

2: The tolerance and allowance of JIS B 1514 are a little different from those of ABMA standards.

- ⑥ To be applied in case snap rings are not installed on the bearings.
- ⑦ Applies to ball bearings such as deep groove ball bearings and angular ball bearings.
- ⑧ Nominal outer diameter of bearings of 2.5 mm is included in this dimensional division.

500	630	+50	0	+70	0	70

① Applies to all radial flat planes of inner ring tapered bore.

② Does not apply to diameter series 7 and 8.

Note: Quantifiers

For a standard taper ratio of 1:12  $d_1 = d + \frac{1}{12} B$

For a standard taper ratio of 1:30  $d_1 = d + \frac{1}{30} B$

$\Delta d_{mp}$  : Dimensional difference of the average bore diameter within the flat surface at the theoretical small end of the tapered bore.

$\Delta d_{1mp}$  : Dimensional difference of the average bore diameter within the flat surface at the theoretical large end of the tapered bore.

$V_{dp}$  : Unevenness of the bore diameter with the flat surface

$B$  : Nominal width of inner ring

$\alpha$  : Half of the tapered bore's nominal taper angle

For a standard taper ratio of 1:12  $\alpha = 2^\circ 23' 9.4''$

For a standard taper ratio of 1:30  $\alpha = 0^\circ 57' 7.4''$

## 6.3 Bearing tolerance measurement methods

For reference, measurement methods for rolling bearing tolerances are in JIS B 1515.

Table 6.11 shows some of the major methods of measuring rotation tolerances.

Table 6.11 Rotation tolerance measurement methods

Characteristic tolerance	Measurement method	
Inner ring radial runout ( $K_{ia}$ )		 <p>Radial runout of the inner ring is the difference between the maximum and minimum reading of the measuring device when the inner ring is turned one revolution.</p>
Outer ring radial runout ( $K_{ea}$ )		 <p>Radial runout of the outer ring is the difference between the maximum and minimum reading of the measuring device when the outer ring is turned one revolution.</p>
Inner ring axial runout ( $S_{ia}$ )		 <p>Axial runout of the inner ring is the difference between the maximum and minimum reading of the measuring device when the inner ring is turned one revolution.</p>
Outer ring axial runout ( $S_{ea}$ )		 <p>Axial runout of the outer ring is the difference between the maximum and minimum reading of the measuring device when the outer ring is turned one revolution.</p>
Inner ring side runout with bore ( $S_a$ )		 <p>Inner ring side runout with bore is the difference between the maximum and minimum reading of the measuring device when the inner ring is turned one revolution together with the tapered mandrel.</p>
Outer ring outside surface inclination ( $S_b$ )		<p>Outer ring outside surface inclination is the difference between the maximum and minimum reading of the measuring device when the outside ring is turned one revolution along the reinforcing plate.</p>

## 7. Bearing Fits

### 7.1 Fitting

For rolling bearings, inner and outer rings are fixed on the shaft or in the housing so that relative movement does not occur between fitting surfaces during operation or under load. This relative movement between the fitting surfaces of the bearing and the shaft or housing can occur in a radial direction, an axial direction, or in the direction of rotation. Types of fitting include tight, transition and loose fitting, which may be selected depending on whether or not there is interference.

The most effective way to fix the fitting surfaces between a bearing's raceway and shaft or housing is to apply a **"tight fit."** The advantage of this tight fit for thin walled bearings is that it provides uniform load support over the entire ring circumference without any loss of load carrying capacity. However, with a tight fit, ease of installation and disassembly is lost; and when using a non-separable bearing as the floating-side bearing, axial displacement is not possible. For this reason, a tight fit cannot be recommended in all cases.

### 7.2 The necessity of a proper fit

In some cases, improper fit may lead to damage and shorten bearing life, therefore it is necessary to make a careful investigation in selecting a proper fit. Some of the bearing failure caused by improper fit are listed below.

- Raceway cracking, early flaking and displacement of raceway
- Raceway and shaft or housing abrasion caused by creeping and fretting corrosion
- Seizing caused by negative internal clearances

- Increased noise and deteriorated rotational accuracy due to raceway groove deformation

Please refer to insert pages A-96 ~ A-99 for information concerning diagnosis of these conditions.

### 7.3 Fit selection

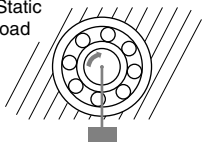

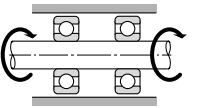

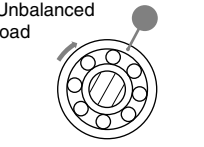

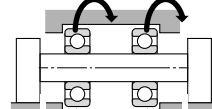

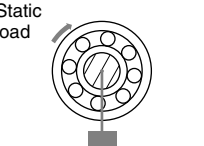

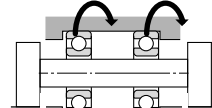

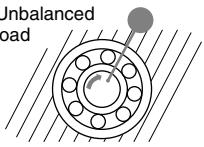

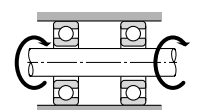

Selection of a proper fit is dependent upon thorough analysis of bearing operating conditions, including consideration of:

- Shaft and housing material, wall thickness, finished surface accuracy, etc.
- Machinery operating conditions (nature and magnitude of load, rotational speed, temperature, etc.)

#### 7.3.1 "Tight fit" or "Loose fit"

- (1) For raceways under rotating loads, a tight fit is necessary. (Refer to **Table 7.1** "Raceways under rotating loads" refers to raceways receiving loads rotating relative to their radial direction. For raceways under static loads, on the other hand, a loose fit is sufficient.  
(Example) Rotating inner ring load = the direction of the radial load on the inner ring is rotating relatively
- (2) For non-separable bearings, such as deep groove ball bearings, it is generally recommended that either the inner ring or outer ring be given a loose fit.

Table 7.1 Radial load and bearing fit

Illustration	Bearing rotation	Ring load	Fit
 <p>Static load</p>	 <p>Inner ring: Rotating Outer ring: Stationary</p>	Rotating inner ring load	Inner ring : Tight fit
 <p>Unbalanced load</p>	 <p>Inner ring: Stationary Outer ring: Rotating</p>	Static outer ring load	Outer ring : Loose fit
 <p>Static load</p>	 <p>Inner ring: Stationary Outer ring: Rotating</p>	Static inner ring load	Inner ring : Loose fit
 <p>Unbalanced load</p>	 <p>Inner ring: Rotating Outer ring: Stationary</p>	Rotating outer ring load	Outer ring : Tight fit

### 7.3.2 Recommended Fits

Bearing fit is governed by the selection tolerances for bearing shaft diameters and housing bore diameters.

Widely used fits for 0 Class tolerance bearings and various shaft and housing bore diameter tolerances are shown in Fig. 7.1.

Generally-used, standard fits for most types of bearings and operating conditions are shown in Tables 7.2 - 7.7.

**Table 7.2:** Fits for radial bearings

**Table 7.3:** Fits for thrust bearings

**Table 7.4:** Fits for electric motor bearings

**Table 7.6:** Fits for inch series tapered roller bearings (ANSI Class 4)

**Table 7.7:** Fits for inch series tapered roller bearings (ANSI Class 3 and 0)

**Table 7.5.** shows fits and their numerical values.

For special fits or applications, please consult NTN Engineering.

### 7.3.3 Interference minimum and maximum values

The following points should be considered when it is necessary to calculate the interference for an application:

- In calculating the minimum required amount of interference keep in mind that:
  - 1) interference is reduced by radial loads
  - 2) interference is reduced by differences between bearing temperature and ambient temperature
  - 3) interference is reduced by variation of fitting surfaces
- The upper limit value should not exceed 1/1000 of the shaft diameter.

Required interference calculations are shown below.

#### (1) Radial loads and required interference

Interference of the inner ring and shaft decreases when a radial load is applied to the bearing. The interference required to secure effective interference is expressed by formulae (7.1) and (7.2).

$$\begin{aligned} F_r &\leq 0.3 C_{or} \\ \Delta_{dF} &= 0.08 (d \cdot F_r / B)^{1/2} \quad \left. \begin{array}{l} \text{N} \\ \{\text{kgf}\} \end{array} \right\} \dots\dots\dots(7.1) \\ &= 0.25 (d \cdot F_r / B)^{1/2} \end{aligned}$$

$$\begin{aligned} F_r &> 0.3 C_{or} \\ \Delta_{dF} &= 0.02 (F_r / B) \quad \left. \begin{array}{l} \text{N} \\ \{\text{kgf}\} \end{array} \right\} \dots\dots\dots(7.2) \\ &= 0.2 (F_r / B) \end{aligned}$$

Where,

- $\Delta_{dF}$  : Required effective interference according to radial load  $\mu\text{m}$
- $d$  : Bearing bore diameter mm
- $B$  : Inner ring width mm
- $F_r$  : Radial load N {kgf}
- $C_{or}$  : Basic static load rating N {kgf}

#### (2) Temperature difference and required interference

Interference between inner rings and steel shafts is reduced as a result of temperature increases (difference between bearing temperature and ambient temperature,  $\Delta T$ ) caused by bearing rotation. Calculation of the minimum required amount of interference in such cases is

shown in formula (7.3).

$$\Delta_{dT} = 0.0015 \cdot d \cdot \Delta T \dots\dots\dots(7.3)$$

- $\Delta_{dT}$  : Required effective interference for temperature difference  $\mu\text{m}$
- $\Delta T$  : Difference between bearing temperature and ambient temperature  $^{\circ}\text{C}$
- $d$  : Bearing bore diameter mm

#### (3) Fitting surface variation and required interference

Interference decreases because the fitting surface is smoothed by fitting (surface roughness is reduced). The amount the interference decreases depends on roughness of the fitting surface. It is generally necessary to anticipate the following decrease in interference.

- For ground shafts: 1.0~2.5  $\mu\text{m}$
- For lathed shafts: 5.0~7.0  $\mu\text{m}$

#### (4) Maximum interference

When bearing rings are installed with an interference fit, tension or compression stress may occur along their raceways. If interference is too great, this may cause damage to the rings and reduce bearing life. You should try to obtain the previously described upper limit.

### 7.3.4 Other details

- (1) Tight interference fits are recommended for,
  - Operating conditions with large vibration or shock loads
  - Applications using hollow shafts or housings with thin walls
  - Applications using housings made of light alloys or plastic
- (2) Small interference fits are preferable for,
  - Applications requiring high running accuracy
  - Applications using small sized bearings or thin walled bearings
- (3) Consideration must also be given to the fact that fit selection will effect internal bearing clearance selection. (refer to page insert A-58)

Fig 7.1 State of fitting

(4) A particular type of fit is recommended for SL type cylindrical roller bearings.

**Table 7.2 General standards for radial bearing fits (JIS Class 0, 6X, 6)**

**Table 7.2 (1) Tolerance class of shafts commonly used for radial bearings (classes 0, 6X and 6)**

Conditions		Ball bearings		Cylindrical roller bearing Tapered roller bearing		Spherical roller bearing		Shaft tolerance class	Remarks
		Shaft diameter (mm)

All loads	All bearing types	All shaft diameters	Tolerance class	h9 / IT5 <sup>②</sup>	General applications
				h10/ IT7 <sup>②</sup>	Transmission shafts, etc.

① Standards for light loads, normal loads, and heavy loads

- Light loads: equivalent radial load  $\leq 0.06 C_r$
- Normal loads:  $0.06 C_r < \text{equivalent radial load} \leq 0.12 C_r$
- Heavy loads:  $0.12 C_r < \text{equivalent radial load}$

② IT5 and IT7 show shaft roundness tolerances, cylindricity tolerances, and related values.

Note: All values and fits listed in the above tables are for solid steel shafts.

Table 7.2 (3) Tolerance class of housing bore commonly used for radial bearings (classes 0, 6X and 6)

Housing	Conditions			Toleration class of housing bore	Remarks
	Types of load	Outer ring axial <sup>②</sup> direction movement			
Single housing or divided housing	Outer ring static load	All types of loads	Able to move.	H7	G7 will suffice for large bearings or bearings with large temperature differential between the outer ring and housing.
		Light load <sup>①</sup> or ordinary load <sup>①</sup>	Able to move.	H8	—
		Shaft and inner ring become hot.	Able to move easily.	G7	F7 will suffice for large bearings or bearings with large temperature differential between the outer ring and housing.
Single housing	Indeterminate load	Requires precision rotation with light or ordinary loads.	As a rule, cannot move.	K6	Primarily applies to roller bearings.
			Able to move.	JS6	Primarily applies to ball bearings.
		Requires quiet operation.	Able to move.	H6	—
	Indeterminate load	Light or ordinary load	Able to move.	JS7	If precision is required, JS6 and K6 are used in place of JS7 and K7.
		Ordinary load or heavy load <sup>①</sup>	As a rule, cannot move.	K7	
		Large impact load	Cannot move.	M7	
	Outer ring rotational load	Light or fluctuating load	Cannot move.	M7	—
		Ordinary or heavy load	Cannot move.	N7	Primarily applies to ball bearings.
		Heavy load or large impact load with thin housing	Cannot move.	P7	Primarily applies to roller bearings.

① Standards for light loads, normal loads, and heavy loads

- Light loads: equivalent radial load  $\leq 0.06 C_r$
- Normal loads:  $0.06 C_r < \text{equivalent radial load} \leq 0.12 C_r$
- Heavy loads:  $0.12 C_r < \text{equivalent radial load}$

② Indicates whether or not outer ring axial displacement is possible with non-separable type bearings.

Note 1: All values and fits listed in the above tables are for cast iron or steel housings.

2: If only center axial load is applied to the bearing, select a tolerance class that provides clearance for the outer ring in the axial direction.

**Table 7.3 Standard fits for thrust bearings (JIS Class 0 and 6)**

**Table 7.3 (1) Shaft fits**

Bearing type	Load conditions	Fit	Shaft diameter mm over      incl.	Tolerance class
All thrust bearings	Centered axial load only	Transition fit	All sizes	js6 or h6
Spherical roller thrust bearings	Combined load Inner ring static load or Inner ring rotating load Indeterminate load	Transition fit	All sizes	js6
		Tight fit	— ~ 200 200 ~ 400 400 ~	k6 or js6 m6 or k6 n6 or m6

**Table 7.3 (2) Housing fits**

Bearing type	Load conditions	Fit	Tolerance class	Remarks
All thrust bearings	Centered axial load only	Loose fit	Select a tolerance class that will provide clearance between outer ring and housing.	
			H8	Greater accuracy required with thrust ball bearings
Spherical roller thrust bearings	Combined load Outer ring static load Indeterminate load or outer ring rotating load	Transition fit	H7	—
			K7	Normal operating conditions
			M7	For relatively large radial loads

Note: All values and fits listed in the above tables are for cast iron or steel housings.

**Table 7.4 Fits for electric motor bearings**

Bearing type	Shaft fits		Housing fits	
	Shaft diameter mm over      incl.	Tolerance class	Housing bore diameter	Tolerance class
Deep groove ball bearings	~ 18 18 ~ 100 100 ~ 160	j5 k5 m5	All sizes	H6 or J6
Cylindrical roller bearings	~ 40 40 ~ 160 160 ~ 200	k5 m5 n6	All sizes	H6 or J6

		304.8 ~ 609.6		+25	0	- 13	- 38	63T	~ 13T	
		609.6 ~ 914.4		+38	0	- 13	- 51	89T	~ 13T	

① Fitting symbol "L" indicates clearance and "T" indicates interference.

Note: For class 0, bearing outer diameter  $D$  applies to 304.8 mm or less.

## 8. Bearing Internal Clearance and Preload

### 8.1 Bearing internal clearance

Bearing internal clearance is the amount of internal free movement before mounting.

As shown in **Fig. 8.1**, when either the inner ring or the outer ring is fixed and the other ring is free to move, displacement can take place in either an axial or radial direction. This amount of displacement (radially or axially) is termed the internal clearance and, depending on the direction, is called the radial internal clearance or the axial internal clearance.

When the internal clearance of a bearing is measured, a slight measurement load is applied to the raceway so the internal clearance may be measured accurately. However, at this time, a slight amount of elastic deformation of the bearing occurs under the measurement load, and the clearance measurement value (measured clearance) is slightly larger than the true clearance. This difference between the true bearing clearance and the increased amount due to the elastic deformation must be compensated for. These compensation values are given in **Table 8.1**. For roller bearings the amount of elastic deformation can be ignored.

The internal clearance values for each bearing class are shown in **Tables 8.3** through **8.11**.

### 8.2 Internal clearance selection

The internal clearance of a bearing under operating conditions (effective clearance) is usually smaller than the same bearing's initial clearance before being installed and operated. This is due to several factors including bearing fit, the difference in temperature between the inner and outer rings, etc. As a bearing's operating clearance has an effect on bearing life, heat generation, vibration, noise, etc.; care must be taken in selecting the most suitable operating clearance.

**Fig. 8.1 Internal clearance**

### 8.2.1 Criteria for selecting bearing internal clearance

A bearing's life is theoretically maximum when operating clearance is slightly negative at steady operation. In reality it is however difficult to constantly maintain this optimal condition. If the negative clearance becomes enlarged by fluctuating operating conditions, heat will be produced and life will decrease dramatically. Under ordinary circumstances you should therefore select an initial internal clearance where the operating clearance is slightly larger than zero.

For ordinary operating conditions, use fitting for ordinary loads. If rotational speed and operating temperature are ordinary, selecting normal clearance enables you to obtain the proper operating clearance. **Table 8.2** gives examples applying internal clearances other than CN (normal) clearance.

### 8.2.2 Calculation of operating clearance

Operating clearance of a bearing can be calculated from initial bearing internal clearance and decrease in internal clearance due to interference and decrease in internal clearance due to difference in temperature of the inner and outer rings.

$$\delta_{\text{eff}} = \delta_o - (\delta_f + \delta_t) \dots\dots\dots (8.1)$$

where,

$\delta_{\text{eff}}$  : Effective internal clearance, mm

$\delta_o$  : Bearing internal clearance, mm

$\delta_f$  : Reduced amount of clearance due to

**Table 8.1 Adjustment of radial internal clearance based on measured load (deep groove ball bearing)** Unit  $\mu\text{m}$

Nominal Bore Diameter <i>d</i> mm	Measuring Load N {kgf}	Internal clearance adjustment						
		over	incl.	C2	CN	C3	C4	C5
10 ①	18	24.5	{2.5}	3~4	4	4	4	4
18	50	49	{5}	4~5	5	6	6	6
50	200	147	{15}	6~8	8	9	9	9

① This diameter is included in the group.

**Table 8.2 Examples of applications where bearing clearances other than CN (normal) clearance are used**

Operating conditions	Applications	Selected clearance
With heavy or shock load, clearance is large.	Railway vehicle axles	C3
	Vibration screens	C3, C4
With indeterminate load, both inner and outer rings are tight-fitted.	Railway vehicle traction motors	C4
	Tractors and final speed regulators	C4
Shaft or inner ring is heated.	Paper making machines and driers	C3, C4
	Rolling mill table rollers	C3
Reduction of noise and vibration when rotating.	Micromotors	C2, CM
Adjustment of clearance to minimize shaft runout.	Main spindles of lathes (Double-row cylindrical roller bearings)	C9NA, C0NA
Loose fitting for both inner and outer rings.	Compressor roll neck	C2

interference, mm

$\delta_t$  : Reduced amount of clearance due to temperature differential of inner and outer rings, mm

### (1) Reduced clearance due to interference

When bearings are installed with interference fits on shafts and in housings, the inner ring will expand and the outer ring will contract; **thus reducing the bearings' internal clearance.** The amount of expansion or contraction varies depending on the shape of the bearing, the shape of the shaft or housing, dimensions of the respective parts, and the type of materials used. The differential can range from approximately **70% to 90% of the effective interference.**

$$\delta_t = (0.70 \sim 0.90) \Delta_{def} \dots\dots\dots (8.2)$$

where,

$\delta_t$  : Reduced amount of clearance due to interference, mm

$\Delta_{def}$  : Effective interference, mm

### (2) Reduced internal clearance due to inner/outer ring temperature difference.

During operation, normally the outer ring will range from 5 to 10°C cooler than the inner ring or rotating parts. However, if the cooling effect of the housing is large, the

shaft is connected to a heat source, or a heated substance is conducted through the hollow shaft; the temperature difference between the two rings can be even greater. **The amount of internal clearance is thus further reduced by the differential expansion of the two rings.**

$$\delta_t = \alpha \cdot \Delta T \cdot D_o \dots\dots\dots (8.3)$$

where,

$\delta_t$  : Amount of reduced clearance due to heat differential, mm

$\alpha$  : Bearing material expansion coefficient  
 $12.5 \times 10^{-6}/^\circ\text{C}$

$\Delta T$  : Inner/outer ring temperature differential, °C

$D_o$  : Outer ring raceway diameter, mm

Outer ring raceway diameter,  $D_o$ , values can be approximated by using formula (8.4) or (8.5).

For ball bearings and spherical roller bearings,

$$D_o = 0.20 (d + 4.0D) \dots\dots\dots (8.4)$$

For roller bearings (except Spherical roller bearing),

$$D_o = 0.25 (d + 3.0D) \dots\dots\dots (8.5)$$

where,

$d$  : Bearing bore diameter, mm

$D$  : Bearing outside diameter, mm

Note1: This table applies to bearings contained in the catalog. For information concerning other bearings or bearings using US customary unit, please contact NTN Engineering.

2: The correlation of axial internal clearance ( $\Delta_a$ ) and radial internal clearance ( $\Delta_r$ ) is expressed as  $\Delta_r = 0.667 \cdot e \cdot \Delta_a$ .

*e*: Constant (see dimensions table)

3: Bearing series 329X, 330, 322C and 323Cdo not apply to the table.

## 8.3 Preload

Normally, bearings are used with a slight internal clearance under operating conditions. However, in some applications, bearings are given an initial load; this means that the bearings' internal clearance is negative before operation. This is called "preload" and is commonly applied to angular ball bearings and tapered roller bearings.

### 8.3.1 Purpose of preload

The following results are obtained by constant elastic compressive force applied to the contact points of rolling elements and raceway by providing preload.

- (1) Bearing's rigidity increases, internal clearance tends not to be produced even when heavy load is applied.
- (2) The particular frequency of the bearing increases and is becomes suitable for high-speed rotation.
- (3) Shaft runout is suppressed; rotation and position precision are enhanced.
- (4) Vibration and noise are controlled.
- (5) Sliding of rolling elements by turning, spinning, or pivoting, is controlled and smearing is reduced.
- (6) Fretting produced by external vibration is prevented.

**Applying excessive preload could result in reduction of life, abnormal heating, or increase in turning torque. You should therefore consider the objectives before determining the amount of preload.**

Table 8.12 Preloading methods and characteristics

Method	Basic pattern	Applicable bearings	Object	Characteristics	Applications
Fixed position preload		Angular contact ball bearings	Maintaining accuracy of rotating shaft, preventing vibration increasing rigidity	Preloading is accomplished by a predetermined offset of the rings or by using spacers. For the standard preload see <b>Table 8.13</b> .	Grinding machines, lathes, milling machines, measuring instruments
		Tapered roller bearings, thrust ball bearings, angular contact ball bearings	Increasing bearing rigidity	Preload is accomplished by adjusting a threaded screw. The amount of preload is set by measuring the starting torque or axial displacement.	Lathes, milling machines, differential gears of automotives, printing machines, wheel axles
Constant pressure preload		Angular contact ball bearings, deep groove ball bearings, tapered roller bearings (high speed)	Maintaining accuracy and preventing vibration and noise with a constant amount of preload without being affected by loads or temperature	Preloading is accomplished by using coil or belleville springs. for deep groove ball bearings: $4 \sim 10 d$ N $0.4 \sim 1.0 d$ {kgf} $d$ : Shaft diameter mm for angular contact ball bearings: see Table 8.13.	Internal grinding machines, electric motors, high speed shafts in small machines, tension reels
		Spherical roller thrust bearings, cylindrical roller thrust bearings, thrust ball bearings	Preload is primarily used to prevent smearing of opposite axial load side when bearing an axial load.	Preload is accomplished by using coil or belleville springs. Recommended preloads are as follows: for thrust ball bearings: $T_1 = 0.42 (nC_{oa})^{1.9} \times 10^{-13}$ N $= 3.275 (nC_{oa})^{1.9} \times 10^{-13}$ {kgf} $T_2 = 0.00083 C_{oa}$ N {kgf} which ever is greater for spherical roller thrust bearings, cylindrical roller thrust bearing $T = 0.025 C_{oa}^{0.8}$ N $= 0.0158 C_{oa}^{0.8}$ {kgf}	Rolling mills, extruding machines

Note: In the above formulas  
 $T$  = preload, N {kgf}  
 $n$  = number of revolutions,  $\text{min}^{-1}$   
 $C_{oa}$  = basic static axial load rating, N {kgf}

### 8.3.2 Preloading methods and amounts

The most common method of applying preload on a bearing is change the relative position of the inner and outer rings of the bearing in the axial direction while applying an axial load between bearings on opposing sides. There are two types of preload: fixed position preload and constant pressure preload.

The basic pattern, purpose and characteristics of bearing preloads are shown in **Table 8.12**. The fixed position preload is effective for positioning the two bearings and also for increasing the rigidity. Due to the use of a spring for the constant pressure preload, the preloading amount can be kept constantly, even when the distance between the two bearings fluctuates under the influence of operating heat and load.

Also, the standard preloading amount for the paired angular contact ball bearings is shown in **Table 8.13**. Light and normal preload is applied to prevent general vibration, and medium and heavy preload is applied especially when rigidity is required.

### 8.3.3 Preload and rigidity

The increased rigidity effect preloading has on bearings is shown in **Fig. 8.2**. When the offset inner rings of the two paired angular contact ball bearings are pressed together, each inner ring is displaced axially by the amount  $\delta_o$  and is thus given a preload,  $F_o$ , in the direction. Under this condition, when external axial load  $F_a$  is applied, bearing I will have an increased displacement by the amount  $\delta_a$  and bearing II's displacement will decrease. At this time the loads applied to bearing I and II are  $F_I$  and  $F_{II}$ , respectively.

Under the condition of no preload, bearing I will be displaced by the amount  $\delta_b$  when axial load  $F_a$  is applied. Since the amount of displacement,  $\delta_a$ , is less than  $\delta_b$ , it indicates a higher rigidity for  $\delta_a$ .

## 9. Allowable Speed

As rotational speed of the bearing increase, the temperature of the bearing also rises due to heat produced inside the bearing by friction. This causes damage to the bearing such as seizure, and the bearing will be unable to continue stable operation. Therefore, the maximum speed at which it is possible for the bearing to continuously operate without the generation of excessive heat beyond specified limits, is called the **allowable speed** ( $\text{min}^{-1}$ ).

The allowable speed of a bearing depends on the type of bearing, bearing dimensions, type of cage, load, lubricating conditions, and cooling conditions.

The bearing dimensions table gives approximate allowable rotational speeds for grease and oil lubrication. The values are based on the following:

- The bearing must have the proper internal clearance prescribed in the NTN Engineering standard design specifications and must be properly installed.
- A quality lubricant must be used. The lubricant must be replenished and changed when necessary.
- The bearing must be operated at normal operating temperature under ordinary load conditions ( $P \leq 0.09 C_r, F_a / F_r \leq 0.3$ ).

If load is  $P \leq 0.04 C_{or}$ , the rolling elements may not turn smoothly. If so, please contact NTN Engineering for more information. Allowable rotational speed for deep groove ball bearings with contact seal (LLU type) or low-torque seal (LLH type) is determined according to the circumferential speed of the seal.

For bearings to be used under heavier than normal load conditions, the allowable speed values listed in the bearing tables must be multiplied by an adjustment factor. The adjustment factors  $f_L$  and  $f_C$  are given in **Figs. 9.1** and **9.2**.

**Also, when radial bearings are mounted on vertical shafts**, lubricant retentions and cage guidance are not favorable compared to horizontal shaft mounting.

Therefore, the allowable speed should be reduced to **approximately 80% of the listed speed**.

For speeds other than those mentioned above, and for which data is incomplete, please consult NTN Engineering.

If rotational speed is to exceed allowable rotational speed given in the dimensions table, it will require special considerations such as using a bearing for which cage specifications, internal clearance and precision have been thoroughly checked. It will also require adopting forced circulation, jet oil or mist oil lubrication as the lubrication method.

Under such high speed operating conditions, when special care is taken, the standard allowable speeds given in the bearing tables can be adjusted upward. The maximum speed adjustment values,  $f_B$ , by which the bearing table speeds can be multiplied, are shown in **Table 9.1**. However, for any application requiring speeds in excess of the standard allowable speed, please consult NTN Engineering.

Fig. 9.1 Value of adjustment factor  $f_L$  depends on bearing load

Fig. 9.2 Value of adjustment factor  $f_C$  depends on combined load

Table 9.1 Adjustment factor,  $f_B$ , for allowable number of revolutions

Type of bearing	Adjustment factor $f_B$
Deep groove ball bearings	3.0
Angular contact ball bearings	2.0
Cylindrical roller bearings	2.5
Tapered roller bearings	2.0

## 10. Friction and Temperature Rise

### 10.1 Friction

One of the main functions required of a bearing is that it must have low friction. Under normal operating conditions rolling bearings have a much smaller friction coefficient than the slide bearings, especially starting friction.

The friction coefficient for rolling bearings is expressed by formula (10.1).

$$\mu = \frac{2M}{Pd} \dots\dots\dots (10.1)$$

where,

- $\mu$  : Friction coefficient
- $M$  : Friction moment, N · mm {kgf · fmm}
- $P$  : Load, N {kgf}
- $d$  : Bearing bore diameter, mm

Although the dynamic friction coefficient for rolling bearings varies with the type of bearings, load, lubrication, speed, and other factors; for normal operating conditions, the approximate friction coefficients for various bearing types are listed in **Table 10.1**.

**Table 10.1 Friction coefficient for bearings (reference)**

Bearing type	Coefficient $\mu \times 10^{-3}$
Deep groove ball bearings	1.0~1.5
Angular contact ball bearings	1.2~1.8
Self-aligning ball bearings	0.8~1.2
Cylindrical roller bearings	1.0~1.5
Needle roller bearings	2.0~3.0
Tapered roller bearings	1.7~2.5
Spherical roller bearings	2.0~2.5
Thrust ball bearings	1.0~1.5
Thrust roller bearings	2.0~3.0

### 10.2 Temperature rise

Almost all friction loss in a bearing is transformed into heat within the bearing itself and causes the temperature of the bearing to rise. The amount of thermal generation caused by friction moment can be calculated using formula (10.2).

$$\left. \begin{aligned} Q &= 0.105 \times 10^{-6} M n \text{ N} \\ &= 1.03 \times 10^{-6} M n \text{ {kgf}} \end{aligned} \right\} \dots\dots\dots (10.2)$$

where,

- $Q$  : Thermal value, kW
- $M$  : Friction moment, N · mm {kgf · fmm}
- $n$  : Rotational speed, min<sup>-1</sup>

Bearing operating temperature is determined by the equilibrium or balance between the amount of heat generated by the bearing and the amount of heat conducted away from the bearing. In most cases the temperature rises sharply during initial operation, then increases slowly until it reaches a stable condition and then remains constant. The time it takes to reach this stable state depends on the amount of heat produced, heat capacity/diffusion of the shaft and bearing housing, amount of lubricant and method of lubrication. If the temperature continues to rise and does not become constant, it must be assumed that there is some improper function.

**Possible causes of abnormal temperature include bearing misalignment (due to moment load or incorrect installation), insufficient internal clearance, excessive preload, too much or too little lubricant, or heat produced from sealed units. Check the mechanical equipment, and if necessary, remove and inspect the bearing.**

# 11. Lubrication

## 11.1 Purpose of lubrication

The purpose of bearing lubrication is to prevent direct metallic contact between the various rolling and sliding elements. This is accomplished through the formation of a thin oil (or grease) film on the contact surfaces. However, for rolling bearings, lubrication has the following advantages:

- (1) Reduction of friction and wear
- (2) Dissipation of friction heat
- (3) Prolonged bearing life
- (4) Prevention of rust
- (5) Protection against harmful elements

In order to exhibit these effects, a lubrication method that matches service conditions. In addition to this, a quality lubricant must be selected, the proper amount of lubricant must be used and the bearing must be designed to prevent foreign matter from getting in or lubricant from leaking out.

Fig. 11.1

Table 11.1 Oil volume, friction loss, bearing temperature (See Fig. 11.1)

Range	Characteristics	Lubrication method
A	When oil volume is extremely low, direct metallic contact occurs in places between the rolling elements and raceway surfaces. Bearing abrasion and seizing occur.	—
B	A thin oil film develops over all surfaces, friction is minimal and bearing temperature is low.	Grease lubrication, oil mist, air-oil lubrication
C	As oil volume increases, heat buildup is balanced by cooling.	Circulating lubrication
D	Regardless of oil volume, temperature increases at a fixed rate.	Circulating lubrication
E	As oil volume increases, cooling predominates and bearing temperature decreases.	Forced circulation lubrication, Oil jet lubrication

Fig. 11.1 shows the relationship between oil volume, friction loss, and bearing temperature. Table 11.1 details the characteristics of this relationship.

## 11.2 Lubrication methods and characteristics

Lubrication method for bearings can be roughly divided into grease and oil lubrication. Each of these has its own features, so the lubrication method that best offers the required function must be selected.

The characteristic are shown in Table 11.2.

Table 11.2 Comparison of grease lubrication and oil lubrication characteristics

Method	Grease lubrication	Oil lubrication
Concern		
Handling	◎	△
Reliability	○	◎
Cooling effect	×	○ (Circulation necessary)
Seal structure	○	△
Power loss	○	○
Environment contamination	○	△
High speed rotation	×	○

◎ : Very good ○ : Good △ : Fair × : Poor

## 11.3 Grease lubrication

Grease lubricants are relatively easy to handle and require only the simplest sealing devices. For these reasons, grease is the most widely used lubricant for rolling bearings. It is used a bearing that is pre-sealed with grease (sealed/shield bearing), or if using an unsealed bearing, fill the bearing and housing with the proper amount of grease, and replenish or change the grease regularly.

### 11.3.1 Types and characteristics of grease

Lubricating grease are composed of either a mineral oil base or a synthetic oil base. To this base a thickener and other additives are added. The properties of all greases are mainly determined by the kind of base oil used and by the combination of thickening agent and various additives. Table 11.5 shows general grease varieties and characteristics, and Table 11.6 shows grease brand names and their natures. (See pages A-74 and A-75.) As performance characteristics of even the same type of grease will vary widely from brand to brand, it is necessary to check the manufacturers' data when selecting a grease.

#### (1) Base oil

Mineral oil or synthetics such as ester or ether oil are used as the base of the grease.

Mainly, the properties of any grease is determined by the properties of the base oil. Generally, greases with low

viscosity base oil are best suited for low temperatures and high speeds; Grease using high-viscosity base oil has superior high-temperature and high-load characteristics.

**(2) Thickening agents**

Thickening agents are compounded with base oils to maintain the semi-solid state of the grease. Thickening agents consist of two types of bases, metallic soaps and non-soaps. Metallic soap thickeners include: lithium, sodium, calcium, etc.

Non-soap base thickeners are divided into two groups; inorganic (silica gel, bentonite, etc.) and organic (poly-urea, fluorocarbon, etc.).

The various special characteristics of a grease, such as limiting temperature range, mechanical stability, water resistance, etc. depend largely on the type of thickening agent used. For example, a sodium based grease is generally poor in water resistance properties, while greases with bentone, poly-urea and other non-metallic soaps as the thickening agent are generally superior in high temperature properties.

**(3) Additives**

Various additives are added to greases to improve various properties and efficiency. For example, there are anti-oxidents, high-pressure additives (EP additives), rust preventives, and anti-corrosives.

For bearings subject to heavy loads and/or shock loads, a grease containing high-pressure additives should be used. For comparatively high operating temperatures or in applications where the grease cannot be replenished for long periods, a grease with an oxidation stabilizer is best to use.

**(4) Consistency**

Consistency is an index that indicates hardness and fluidity of grease. The higher the number, the softer the grease is. The consistency of a grease is determined by the amount of thickening agent used and the viscosity of the base oil. For the lubrication of rolling bearings, greases with the NLGI consistency numbers of 1, 2, and 3 are used.

General relationships between consistency and application of grease are shown in **Table 11.3**.

**(5) Mixing of greases**

When greases of different kinds are mixed together, the consistency of the greases will change (usually softer), the operating temperature range will be lowered, and other changes in characteristics will occur. As a rule, grease should not be mixed with grease of any other brand.

However, if different greases must be mixed, at least greases with the same base oil and thickening agent should be selected.

**Table 11.3 Consistency of grease**

NLGI Consistency No.	JIS (ASTM) 60 times blend consistency	Applications
0	355~385	For centralized greasing use
1	310~340	For centralized greasing use
2	265~295	For general use and sealed bearing use
3	220~250	For general use and high temperature use
4	175~205	For special use

**11.3.2 Amount of grease**

The amount of grease used in any given situation will depend on many factors relating to the size and shape of the housing, space limitations, bearing's rotating speed and type of grease used.

As a rule of thumb, bearings should be filled to 30 to 40% of their space and housing should be filled 30 to 60%.

Where speeds are high and temperature rises need to be kept to a minimum, a reduced amount of grease should be used. **Excessive amount of grease cause temperature rise which in turn causes the grease to soften and may allow leakage. With excessive grease fills oxidation and deterioration may cause lubricating efficiency to be lowered.**

Moreover, the standard bearing space can be found by formula (11.1)

$$V=K \cdot W \dots\dots\dots (11.1)$$

where,

- $V$  : Quantity of bearing space open type (approx.), cm<sup>3</sup>
- $K$  : Bearing space factor (see value of  $K$  in **Table 11.4**)
- $W$  : Mass of bearing, kg

**Table 11.4 Bearing space factor  $K$**

Bearing type	Cage type	$K$
Ball bearings ①	Pressed cage	61

**11.3.3 Grease replenishment**

As the lubricating efficiency of grease declines with the passage of time, fresh grease must be re-supplied at proper intervals. The replenishment time interval depends on the type of bearing, dimensions, bearing's rotating speed, bearing temperature, and type of grease.

An easy reference chart for calculating grease replenishment intervals is shown in **Fig. 11.2**.

This chart indicates the replenishment interval for standard rolling bearing grease when used under normal operating conditions.

As operating temperatures increase, the grease re-supply interval should be shortened accordingly.

Generally, for every 10°C increase in bearing temperature above 80°C, the relubrication period is reduced to "1/1.5".

**Fig. 11.2 Diagram for relubrication interval of greasing**

**(Example)**

Find the grease relubrication time limit for deep groove ball bearing **6206**, with a radial load of 2.0 kN {204kgf} operating at 3,600 min<sup>-1</sup>.

$C_r / P_r = 19.5 / 2.0 \text{ kN} = 9.8$  from **Fig. 11.1**, the adjustment factor,  $f_L$ , is 0.96.

Allowable rotational speed from the dimensions tables for bearing 6206 is 11,000 min<sup>-1</sup>. Allowable rotational speed  $n_o$  for a 2.0 kN {204 kgf} radial load is:

$$n_o = 0.96 \times 11,000 = 10,560 \text{ min}^{-1}$$

$$\text{therefore, } \frac{n_o}{n} = \frac{10,560}{3,600} = 2.93$$

The point where vertical line I intersects a horizontal line drawn from the point equivalent of  $d = 30$  for the radial ball bearing shown in **Fig. 11.2** shall be point A. Find intersection point C where vertical line II intersects the straight line formed by joining point B ( $n_o/n = 2.93$ ) with A with a straight line. It shows that grease life in this case is approximately 5,500 hours.

**11.4 Solid grease (For bearings with solid grease)**

"Solid grease" is a lubricant composed mainly of lubricating grease and ultra-high polymer polyethylene. Solid grease has the same viscosity as grease at normal temperature. If heated once and cooled (this process is referred to as "calcination") the grease hardens while maintaining a large quantity of lubricant. The result of this solidification is that the grease does not easily leak from the bearing, even when the bearing is subjected to strong vibrations or centrifugal force.

Bearings with solid grease are available in two types: the spot-pack type in which solid grease is injected into the cage, and the full-pack type in which all empty space around the rolling elements is filled with solid grease.

Spot-pack solid grease is standard for deep groove ball bearings, small diameter ball bearings, and bearing units. Full-pack solid grease is standard for self-aligning ball bearings, spherical roller bearings, and needle roller bearings.

Primary advantages:

- (1) Grease leakage is minimal.
- (2) Low bearing torque with spot-pack type solid grease

For more details, please refer to NTN special catalog of **Solid grease bearings**.

**Fig. 11.3 Deep groove ball bearing with spot-pack solid grease (Z shield) (Standard for deep groove ball bearings)**

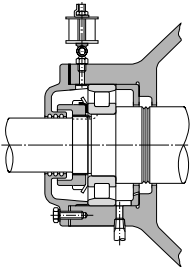

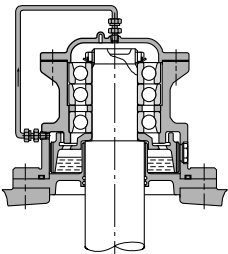

**Fig. 11.4 Spherical roller bearing with full-pack solid grease (Standard for spherical roller bearings)**

11.5 Oil lubrication

Oil lubrication is suitable for applications requiring that bearing-generated heat or heat applied to the bearing from other sources be carried away from the bearing and

dissipated to the outside. **Table 11.7** shows the main methods of oil lubrication.

Table 11.7 Oil lubrication methods

Lubrication method	Example	Lubrication method	Example
<p><b>(Oil bath lubrication)</b></p> <ul style="list-style-type: none"> <li>Oil bath lubrication is the most generally used method of lubrication and is widely used for low to moderate rotation speed applications.</li> <li>For horizontal shaft applications, oil level should be maintained at approximately the center of the lowest rolling element, according to the oil gauge, when the bearing is at rest. For vertical shafts at low speeds, oil level should be maintained at 50-80% submergence of the rolling elements.</li> </ul>		<p><b>(Disc lubrication)</b></p> <ul style="list-style-type: none"> <li>In this method, a partially submerged disc rotates and pulls oil up into a reservoir from which it then drains down through the bearing, lubricating it.</li> </ul>	
<p><b>(Oil spray lubrication)</b></p> <ul style="list-style-type: none"> <li>In this method, an impeller or similar device mounted on the shaft draws up oil and sprays it onto the bearing. This method can be used at considerably high speeds.</li> </ul>		<p><b>(Oil mist lubrication)</b></p> <ul style="list-style-type: none"> <li>Using pressurized air, lubricating oil is atomized before passing through the bearing.</li> <li>Due to the low lubricant resistance, this method is well suited to high speed applications.</li> </ul>	
<p><b>(Drip lubrication)</b></p> <ul style="list-style-type: none"> <li>In this method, oil is collected above the bearing and allowed to drip down into the housing where it becomes a lubricating mist as it strikes the rolling elements. Another version allows only slight amounts of oil to pass through the bearing.</li> <li>Used at relatively high speeds for light to moderate load applications.</li> <li>In most cases, oil volume is a few drops per minute.</li> </ul>		<p><b>(Air-oil lubrication)</b></p> <ul style="list-style-type: none"> <li>In this method, the required minimum amount of lubricating oil is measured and fed to each bearing at ideal intervals using compressed air.</li> <li>With fresh lubricating oil constantly being fed to the bearing, and with the cooling effect of the compressed air, bearing temperature rise can be minimized.</li> <li>Because the required oil quantity is infinitesimal, the working environment can be kept clean. Air-oil lubrication units are available from NTN.</li> </ul>	
<p><b>(Circulating lubrication)</b></p> <ul style="list-style-type: none"> <li>Used for bearing cooling applications or for automatic oil supply systems in which the oil supply is centrally located.</li> <li>One of the advantages of this method is that oil cooling devices and filters to maintain oil purity can be installed within the system.</li> <li>In order for oil to thoroughly lubricate the bearing, oil inlets and outlets must be provided on opposite sides of the bearing.</li> </ul>		<p><b>(Oil jet lubrication)</b></p> <ul style="list-style-type: none"> <li>This method lubricates by injecting oil under high pressure directly into the side of the bearing. This is a reliable system for high speed, high temperature or otherwise severe conditions.</li> <li>Used for lubricating the bearings in jet engines, gas turbines, and other high speed equipment.</li> <li>Under-race lubrication for machine tools is one example of this type of lubrication.</li> </ul>	

11.5.1 Selection of lubricating oil

Under normal operating conditions, **spindle oil, machine oil, turbine oil,** and other mineral oils are widely used for the lubrication of rolling bearings. However, for temperatures **above 150°C** or **below -30°C**, synthetic oils such as **diester oil, silicone oil,** and **fluorocarbon oil** are used.

For lubricating oils, viscosity is one of the most important properties and determines an oil's lubricating efficiency. If viscosity is too low, formation of the oil film will be insufficient, and damage will occur to the raceways of the bearing. If viscosity is too high, viscous resistance will also be great and result in temperature increases and friction loss. In general, for higher speed applications a lower viscosity oil should be used; for heavier load applications, a higher viscosity oil should be used.

In regard to operating temperature, **Table 11.8** lists the required oil viscosity for different types of rolling bearings. **Fig. 11.5** is an oil viscosity - operating temperature comparison chart for the purpose of selecting a lubrication oil with viscosity characteristics appropriate to an application.

**Table 11.9** lists the selection standards for lubricating oil viscosity with reference to bearing operating conditions.

Table 11.8 Required lubricating oil viscosity for bearings

Bearing type	Kinematic viscosity mm <sup>2</sup> /s
Ball bearings, Cylindrical roller bearings, Needle roller bearings	13
Spherical roller bearings, Tapered roller bearings, Needle roller thrust bearings	20
Self-aligning roller thrust bearings	30

11.5.2 Oil quantity

In forced oil lubrication systems, the heat radiated away by the housing and surrounding parts plus the heat carried away by the lubricating oil is approximately equal to the amount of heat generated by the bearing and other sources.

For general housing applications, the required quantity of oil can be found by formula (11.2).

$$Q = K \cdot q \dots\dots\dots (11.2)$$

where,

- Q: Quantity of oil for one bearing cm<sup>3</sup>/min.
- K: Allowable oil temperature rise factor (**Table 11.10**)
- q: Amount of lubrication determined by diagram cm<sup>3</sup>/min. (**Fig. 11.4**)

Because the amount of heat radiated will vary according to the type of housing, for actual operation it is advisable that the quantity of oil calculated by formula

Fig. 11.5 Relation between lubricating oil viscosity and temperature

Table 11.9 Selection standards for lubricating oils (Reference)

Bearing operating temperature °C	dn-value	Lubricating oil ISO viscosity grade (VG)		Suitable bearing
		Normal load	Heavy load or shock load	
-30 ~ 0	Up to allowable rotational speed	22, 32	46	All types
0 ~ 60	Up to 15,000	46, 68	100	All types
	15,000 ~ 80,000	32, 46	68	All types
	80,000 ~ 150,000	22, 32	32	All types but thrust ball bearings
	150,000 ~ 500,000	10	22, 32	Single row radial ball bearings, cylindrical roller bearings
60 ~ 100	Up to 15,000	150	220	All types
	15,000 ~ 80,000	100	150	All types
	80,000 ~ 150,000	68	100, 150	All types but thrust ball bearings
	150,000 ~ 500,000	32	68	Single row radial ball bearings, cylindrical roller bearings
100 ~ 150	Up to allowable rotational speed	320		All types
0 ~ 60	Up to allowable rotational speed	46, 68		Self-aligning roller bearings
60 ~ 100	Up to allowable rotational speed	150		

Note 1: Applied when lubrication method is either oil bath or circulating lubrication.  
 2: Please consult NTN Engineering in cases where operating conditions fall outside the range covered by this table.

Table 11.10 Factor  $K$

Expelled oil temp minus supplied oil temp °C	$K$
10	1.5
15	1
20	0.75
25	0.6

(11.2) be multiplied by a factor of 1.5 or 2.0. Then, the amount of oil can be adjusted to correspond to actual operating conditions.

Furthermore, if it is assumed for calculation purposes that no heat is radiated by the housing, and that all bearing heat is removed by the oil, then the value for shaft diameter,  $d = 0$ .

**(Example)** For tapered roller bearing **30220U** mounted on a flywheel shaft with a radial load of 9.5 kN {969 kgf}, operating at 1,800 min<sup>-1</sup>, what is the amount of lubricating oil ‘ $Q$ ’ required to keep the bearing temperature rise below 15°C.

$$d = 100 \text{ mm,}$$

$$dn = 100 \times 1,800 = 18 \times 10^4$$

From Fig. 11.6  $q = 180 \text{ cm}^3 / \text{min}$

Assume the bearing temperature is approximately equal to the expelled oil temperature,

from Table 11.10, since  $K = 1$

$$Q = 1 \times 180 = 180 \text{ cm}^3 / \text{min}$$

### 11.5.3 Relubrication intervals

The intervals at which lubricating oil should be changed varies depending upon operating conditions, oil quantity, and type of oil used. In general, for oil bath lubrication where the operating temperature is 50°C or less, oil should be replaced once a year. When the operating temperature is between 80°C – 100°C, oil should be replaced at least every three months. For important equipment, it is advisable that lubricating efficiency and oil purity deterioration be checked regularly to determine when oil replacement is necessary.

Fig. 11.6 Oil quantity guidelines

## 12. External bearing sealing devices

External seals have two main functions: to prevent lubricating oil from leaking out, and, to prevent dust, water, and other contaminants from entering the bearing. When selecting a seal, the following factors need to be taken into consideration: the type of lubricant (oil or grease), seal peripheral speed, shaft fitting errors, space limitations, seal friction and resultant heat increase, and cost.

Sealing devices for rolling bearings fall into two main classifications: non-contact seals and contact seals.

- Non-contact seals:** Non-contact seals utilize a small clearance between the shaft and the housing cover. Therefore friction is negligible, making them suitable for high speed applications.

In order to improve sealing capability, clearance spaces are often filled with lubricant.

- Contact seals:** A contact seal is a seal whereby a

formed synthetic rubber lip on a steel plate is pressed against the shaft. Contact seals are generally far superior to non-contact seals in sealing efficiency, although their friction torque and temperature rise coefficients are higher. Furthermore, because the lip portion of a contact seal slides while in contact with the shaft, the allowable seal peripheral speed varies depending on seal type.

Lubrication is required in the place where the seal lip makes contact with the shaft. Ordinary bearing lubricant can also be used for this purpose.

The following chart lists the special characteristics of seals and other points to be considered when choosing an appropriate seal.

Type	Seal construction	Name	Seal characteristics and selection considerations
Non-contact seals		<b>Clearance seal</b>	This is an extremely simple seal design with a small radial clearance.
		<b>Oil groove seal</b> (oil grooves on housing side)	Several concentric oil grooves are provided on the housing inner diameter to greatly improve the sealing effect. When the grooves are filled with lubricant, the intrusion of contaminants from the outside is prevented.
		<b>Oil groove seal</b> (oil grooves on shaft and housing side)	Oil grooves are provided on both the shaft outer diameter and housing inner diameter for a seal with even greater sealing efficiency.
		<b>Axial labyrinth seal</b>	This seal has a labyrinth passageway on the axial side of the housing.
		<b>Radial labyrinth seal</b>	A labyrinth passageway is affixed to the radial side of the housing. For use with split housings. This offers better sealing efficiency than axial labyrinth seals.
		<b>Aligning labyrinth seal</b>	The seal's labyrinth passageway is slanted and has sufficient clearance to prevent contact between the housing projections and the shaft even as the shaft realigns.

**Cautionary points regarding selection**

- In order to improve sealing efficiency, clearances between the shaft and housing should be minimized. However, care should be taken to confirm shaft/bearing rigidity and other factors to avoid direct shaft-housing contact during operation.

**Oil groove clearance (reference)**

Shaft diameter mm	Clearance mm
Up to 50	0.2~0.4
50 or above	0.5~1.0

- Oil groove width, depth (reference)  
width : 2~5 mm  
depth : 4~5 mm
- Three or more oil grooves should be provided.
- Sealing efficiency can be further improved by filling the oil groove portion with grease of which the consistency grade is 150 to 200.
- Grease is generally used as the lubricant for labyrinth seals, and, except in low speed applications, is commonly used together with other sealing devices.

**Cautionary points regarding selection**

- In order to improve sealing efficiency, labyrinth passageway clearances should be minimized. However, care should be taken to confirm shaft/bearing rigidity, fit, internal clearances and other factors to avoid direct contact between labyrinth projections during operation.

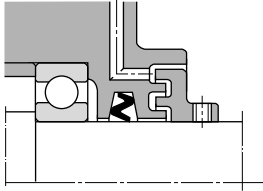

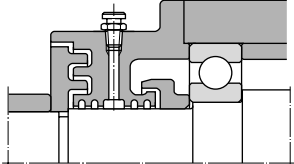

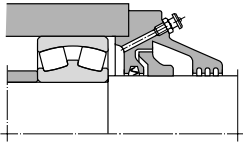

**Labyrinth clearance (reference)**

Shaft diameter mm	Clearance mm	
	Radial direction	Axial direction
— ~ 50	0.2~0.4	1.0~2.0
50~200	0.5~1.0	3.0~5.0

- Sealing efficiency can be further improved by filling the labyrinth passageway with grease of which the consistency grade is 150 to 200.
- Labyrinth seals are suitable for high speed applications.

Type	Seal construction	Name	Seal characteristics and selection considerations																					
Non-contact seals		<b>Oil comb sleeve</b>	In this design, lubricating oil that makes its way out of the housing along the shaft is thrown off by projections on the oil comb sleeve and recirculated.																					
		<b>Slinger provided in the housing</b>	Seal type whereby a slinger is provided in the housing that prevents lubricant from leaking by centrifugal force produced by rotation.																					
		<b>Slinger provided outside the housing</b>	By mounting a slinger on the outside of the housing, centrifugal force helps to prevent dust and other solid contaminants from entering.																					
Contact seals		<b>Z grease seal</b>	In cross section resembling the letter "Z," this seal's empty spaces are filled with grease. The seal is commonly used with a plumber block (bearing housing).																					
		<b>V-ring seal</b>	This design enhances sealing efficiency with a lip that seals from the axial direction. With the aid of centrifugal force, this seal also offers effective protection against dust, water, and other contaminants entering the bearing. Can be used for both oil and grease lubrication. At seal peripheral speeds in excess of 12 m/s, seal ring fit is lost due to centrifugal force, and a clamping band is necessary to hold it in place.																					
		<b>Oil seal</b>	Oil seals are widely used, and their shapes and dimensions are standardized under JIS B 2402. In this design, a ring-shaped spring is installed in the lip section. As a result, optimal contact pressure is exerted between the lip edge and shaft surface, and sealing efficiency is good.  When the bearing and oil seal are in close proximity, the internal clearance of the bearing may be reduced by heat produced by the oil seal. In addition to considering the heat generated by contact seals at various peripheral speeds, internal bearing clearances must also be selected with caution.  Depending on its orientation, the seal may function to prevent lubricant from leaking out or foreign matter from getting in.																					
		For dust proof																						
		For preventing lubricant leakage																						
			<p>Cautionary points regarding selection</p> <ul style="list-style-type: none"> <li>Seal type whereby a slinger that utilizes centrifugal force is provided on the rotating shaft.</li> <li>If mounted on the inside of the housing, the slinger should function to seal in lubricant by centrifugal force produced by rotation.</li> <li>If mounted on the outside of the housing, the slinger should function to seal out foreign matter by fan effect produced by rotation.</li> <li>These seal types are commonly employed together with other sealing devices.</li> </ul>

Type	Seal construction	Name	Seal characteristics and selection considerations
Combination seals		<b>Z-seal + Labyrinth seal</b>	<p>This is an example of an axial labyrinth seal which has been combined with a Z-seal to increase its sealing efficiency. The axial labyrinth seal is affixed to the shaft with a setting bolt or other method. In the diagram on the left, both the direction of the Z-seal and the labyrinth seal are oriented to keep dust and other contaminants out of the bearing.</p> <p>Because a Z-seal has been incorporated, the allowable peripheral speed should not exceed 6 m/s.</p>
		<b>Labyrinth seal + Oil groove seal + Slinger</b>	<p>This is an example of a combination of three different non-contact seals. It has the advantage of preventing both lubricant leakage from inside the bearing and infiltration of dust and other contaminants from the outside. It is widely used on mining equipment and as a sealing system with plummer blocks in extremely dusty application conditions.</p>
		<b>Oil groove seal + Slinger + Z-seal</b>	<p>This is an example where an oil groove seal and slinger have been combined with a Z-seal to increase its sealing efficiency. In the diagram on the left, all three seals have been oriented to keep dust and other contaminants out of the bearing. The combination is widely used on mining equipment and as a sealing system with plummer blocks in extremely dusty application conditions.</p>

## 13. Bearing Materials

### 13.1 Raceway and rolling element materials

While the contact surfaces of a bearing's raceways and rolling elements are subjected to repeated heavy stress, they still must maintain high precision and rotational accuracy. To accomplish this, the raceways and rolling elements must be made of a material that has high hardness, is resistant to rolling fatigue, is wear resistant, and has good dimensional stability. The most common cause of fatigue in bearings is the inclusion of non-metallic impurities in the steel. Non-metallic inclusion includes hard oxides that can cause fatigue crack. Clean steel with minimal non-metallic inclusion must therefore be used.

For all NTN bearings, steel low in oxygen content and non-metallic impurities, then refined by a vacuum degassing process as well as outside hearth smelting, is used. For bearings requiring especially high reliability and long life, steels of even higher in purity, such as vacuum melted steel (VIM, VAR) and electro-slag melted steel (ESR), are used.

#### 1) High/mid carbon alloy steel

In general, steel varieties which can be hardened not just on the surface but also deep hardened by the so-called "through hardening method" are used for the raceways and rolling elements of bearings. Foremost among these is high carbon chromium bearing steel, which is widely used. For large type bearings and bearings with large cross sectional dimensions, induction hardened bearing steel incorporating manganese or molybdenum is used. Also in use is mid-carbon chromium steel incorporating silicone and manganese, which gives it hardening properties comparable to high carbon chromium steel.

**Table 13.1** gives chemical composition of representative high carbon chrome bearing steel that meets JIS standards. SUJ2 is frequently used. SUJ3 with enhanced hardening characteristics containing a large quantity of Mn is used for large bearings. SUJ5 is SUJ3 to which Mo has been added to further enhance hardening characteristics, and is used for oversized bearings or bearings with thick walls.

The chemical composition of SUJ2 is equivalent to AISI 52100 (US) and DIN 100Cr6 (Germany).

#### 2) Case hardened (carburizing) steel

Carburizing hardens the steel from the surface to the proper depth, forming a relatively soft core. This provides hardness and toughness, making the material suitable for impact loads. NTN uses case hardened steel for almost all of its tapered roller bearings. In terms of case hardened steel for NTN's other bearings, chromium steel and chrome molybdenum steel are used for small to medium sized bearings, and nickel chrome molybdenum steel is used for large sized bearings.

**Table 13.2** gives the chemical composition of representative JIS case hardened steel.

#### 3) Heat resistant bearing steel

When bearings made of ordinary high carbon chromium

steel which have undergone standard heat treatment are used at temperatures above 120°C for long durations, unacceptably large dimensional changes can occur. For this reason, a dimension stabilizing treatment (TS treatment) has been devised for very high temperature applications. This treatment however reduces hardness of the material, thereby reducing rolling fatigue life. (See item 3.3.2 on page A-18.)

For standard high temperature bearings used at temperatures from 150°C – 200°C, the addition of silicone to the steel improves heat resistance and results in a bearing with excellent rolling fatigue life with minimal dimensional change or softening at high temperatures.

A variety of heat resistant steels are also incorporated in bearings to minimize softening and dimensional changes when used at high temperatures. Two of these are high speed molybdenum steel and high speed tungsten steel. For bearings requiring heat resistance in high speed applications, there is also heat resistant case hardening molybdenum steel. (refer to **Table 13.3**)

#### 4) Corrosion resistant bearing steel

For applications requiring high corrosion resistance, stainless steel is used. To achieve this corrosion resistance a large proportion of the alloying element chrome is added to martensite stainless steel. (**Table 13.4**)

#### 5) Induction hardened steel

Besides the use of surface hardening steel, induction hardening is also utilized for bearing raceway surfaces, and for this purpose mid-carbon steel is used for its lower carbon content instead of through hardened steel. For induction hardening of the deep layers required for larger bearings and bearings with large surface dimensions, mid-carbon steel is fortified with chrome and molybdenum.

#### 6) Other bearing materials

For ultra high speed applications and applications requiring very high level corrosion resistance, ceramic bearing materials such as Si<sub>3</sub>N<sub>4</sub> are also available.

### 13.2 Cage materials

Bearing cage materials must have the strength to withstand rotational vibrations and shock loads. These materials must also have a low friction coefficient, be light weight, and be able to withstand bearing operation temperatures.

For small and medium sized bearings, pressed cages of cold or hot rolled steel with a low carbon content of approx. 0.1% are used. However, depending on the application, austenitic stainless steel is also used.

Machined cages are generally used for large bearings. Carbon steel for machine structures or high-strength cast brass is frequently used for the cages, but other materials such as aluminum alloy are also used.

Tables 13.5 and 13.6 give the chemical composition for these representative cage materials.

Besides high-strength brass, medium carbon nickel, chrome and molybdenum that has been hardened and tempered at high temperatures are also used for bearings used in aircraft. The materials are often plated with silver to enhance lubrication characteristics.

High polymer materials that can be injection molded are

also widely used for cages. Polyamide resin reinforced with glass fibers is generally used. Cages made of high-polymer materials are lightweight and corrosion resistant. They also have superior damping and characteristics and lubrication performance. **Heat resistant polyimide resins now enable the production of cages that perform well in applications ranging between -40°C – 120°C.** However, they are not recommended for use at temperatures exceeding 120°C.

Table 13.1 Chemical composition of representative high carbon chrome bearing steels

Standard	Symbol	Chemical composition (%)							Remarks

## 14. Shaft and Housing Design

Depending upon the design of a shaft or housing, the shaft may be influenced by an unbalanced load or other factors which can then cause large fluctuations in bearing efficiency. For this reason, it is necessary to pay attention to the following when designing shaft and housing:

- 1) Bearing arrangement selection; most effective fixing method for bearing arrangement
- 2) Selection of shoulder height and fillet radius of housing and shaft.
- 3) Shape precision and dimensions of fitting; area runout tolerance of shoulder.
- 4) Machining precision and mounting error of housing and shaft suitable for allowable alignment angle and inclination of bearing.

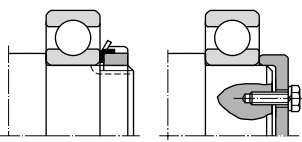

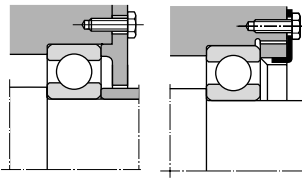

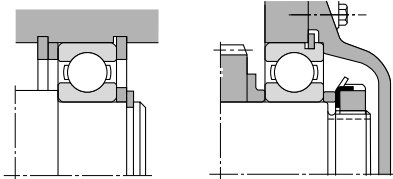

### 14.1 Fixing of bearings

When fixing a bearing in position on a shaft or housing, there are many instances where the interference fit alone is not enough to hold the bearing in place. Bearings must be fixed in place by various methods so that they do not move axially when placed under load.

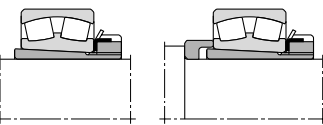

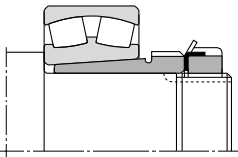

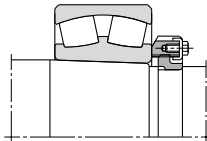

Moreover, **even bearings which are not subjected to axial loads (such as cylindrical roller bearings, etc.), must be fixed in place axially because of the potential for ring displacement due to shaft deflection by moment load which may cause damage.**

**Table 14.1** shows general bearing fixing methods, and **Table 14.2** shows fixing methods for bearings with tapered bores.

**Table 14.1 General bearing fixing methods**

Inner ring clamp	Outer ring clamp	Snap ring
		
<p>The most common method of fixing bearings in place is to use clamping nuts or bolts to hold the bearing or housing abutment against the ring end face.</p>		<p>Use of snap rings regulated under JIS B 2804, B 2805, and B 2806, makes construction very simple. However, interference with chamfers, bearing installation dimensions, and other related specifications must be considered carefully.</p> <p>Snap rings are not suitable for applications requiring high accuracy and where the snap ring receives large axial loads.</p>

**Table 14.2 Fixing methods for bearings with tapered bores**

Adapter sleeve mounting	Withdrawal sleeve mounting	Split ring mounting
		
<p>When installing bearings on cylindrical shafts, adapter sleeves or withdrawal sleeves can be used to fix bearings in place axially.</p> <p>The adapter sleeve is fastened in place by frictional force between the shaft and inner diameter of the sleeve.</p>		<p>For installation of tapered bore bearings directly on tapered shafts, the bearing is held in place by a split ring inserted into a groove on the shaft, and is fixed in place by a split ring nut or screw.</p>

## 14.2 Bearing fitting dimensions

### 14.2.1 Abutment height and fillet radius

The shaft and housing abutment height ( $h$ ) should be larger than the bearings' maximum allowable chamfer dimensions ( $r_{s \max}$ ), and the abutment should be designed so that it directly contacts the flat part of the bearing end face. The fillet radius ( $r_a$ ) must be smaller than the bearing's minimum allowable chamfer dimension ( $r_{s \min}$ ) so that it does not interfere with bearing seating. **Table 14.3** lists abutment height ( $h$ ) and fillet radius ( $r_a$ ).

For bearings to be applied to very large axial loads as well, shaft abutments ( $h$ ) should be higher than the values in the table.

### 14.2.2 For spacer and ground undercut

In cases where a fillet radius ( $r_{a \max}$ ) larger than the bearing chamfer dimension is required to strengthen the shaft or to relieve stress concentration (**Fig. 14.1a**), or where the shaft abutment height is too low to afford adequate contact surface with the bearing (**Fig. 14.1b**), spacers may be used effectively.

Relief dimensions for ground shaft and housing fitting surfaces are given in **Table 14.4**.

Fig. 14.1 Bearing mounting with spacer

Table 14.3 Fillet radius and abutment height Unit mm

$r_{s \min}$	$r_{as \max}$	$h$ (min)	
		Normal use <sup>①</sup>	Special use <sup>②</sup>
0.05	0.05	0.3	
0.08	0.08	0.3	
0.1	0.1	0.4	
0.15	0.15	0.6	
0.2	0.2	0.8	
0.3	0.3	1.25	1
0.6	0.6	2.25	2
1	1	2.75	2.5
1.1	1	3.5	3.25
1.5	1.5	4.25	4
2	2	5	4.5
2.1	2	6	5.5
2.5	2	6	5.5
3	2.5	7	6.5

5	7.4	0.6	5
6	8.6	0.6	6
7.5	10	0.6	7

### 14.2.3 Thrust bearings and fitting dimensions

For thrust bearings, it is necessary to make the raceway washer back face sufficiently broad in relation to load and rigidity, and fitting dimensions from the dimension tables should be adopted. (Figs. 14.2 and 14.3)

For this reason, shaft and abutment heights will be larger than for radial bearings. (Refer to dimension tables for all thrust bearing fitting dimensions.)

Fig. 14.2

Fig. 14.3

### 14.3 Shaft and housing accuracy

Table 14.5 shows the accuracies for shaft and housing fitting surface dimensions and configurations, as well as fitting surface roughness and abutment squareness for normal operating conditions.

Table 14.5 Shaft and housing accuracy

Characteristics		Shaft	Housing
Dimensional accuracy		IT6 (IT5)	IT7 (IT5)
Roundness (max.)		IT3	IT4
Cylindricity		IT3	IT4
Abutment squareness		IT3	IT3
Fitting surface roughness	Small size bearings	0.8a	1.6a
	Mid-large size bearings	1.6a	3.2a

Note: For precision bearings (P4, P5 accuracy), it is necessary to increase the circularity and cylindricity accuracies in this table by approximately 50%. For more specific information, please consult the NTN precision rolling bearing catalog.

### 14.4 Allowable bearing misalignment

A certain amount of misalignment of a bearing's inner and outer rings occurs as a result of shaft flexure, shaft or housing finishing irregularities, and minor installation error. In situations where the degree of misalignment is liable to be relatively large, self-aligning ball bearings, spherical roller bearings, bearing units and other bearings with aligning properties are advisable. Although allowable misalignment will vary according to bearing type, load conditions, internal clearances, etc., Table 14.6 lists some general misalignment standards for normal applications. In order to avoid shorter bearing life and cage failure, it is necessary to maintain levels of misalignment below these standard levels.

Table 14.6 Bearing type and allowable misalignment/alignment allowance

Allowable misalignment	
Deep groove ball bearings	1/1,000~1/300
Angular contact ball bearings	
Single row	1/1,000
Multi row	1/10,000
back to back arrangement	1/10,000
Face to face arrangement	1/1,000
Cylindrical roller bearings	
Bearing series 2, 3, 4	1/1,000
Bearing series 22, 23, 49, 30	1/2,000
Tapered roller bearings	
Single row/back to back arrangement	1/2,000
Face-to-face arrangement	1/1,000
Needle roller bearings	1/2,000
Thrust bearings (excluding self-aligning roller thrust bearings)	1/10,000
Alignment allowance	
Self-aligning ball bearings	1/20~1/15
Spherical roller bearings	1/50~1/30
Self-aligning roller thrust bearings	1/30
Ball bearing units	
Without cover	1/30
With cover	1/50

## 15. Bearing Handling

Bearings are precision parts and, in order to preserve their accuracy and reliability, care must be exercised in their handling.

**In particular, bearing cleanliness must be maintained, sharp impacts avoided, and rust prevented.**

### 15.1 Bearing storage

Most rolling bearings are coated with a rust prevent oil before being packed and shipped, and they should be stored at room temperature with a relative humidity of less than 60%.

### 15.2 Installation

When bearings are being installed on shafts or in housings, the bearing rings should never be struck directly with a hammer or a drift, as shown in **Fig. 15.1**, because damage to the bearing may result. **Any force applied to the bearing should always be evenly distributed over the entire bearing ring face.** Also, when fitting both rings simultaneously, applying pressure to one ring only, as shown in **Fig. 15.2**, should be avoided because indentations in the raceway surface may be caused by the rolling elements, or other internal damage may result.

Fig. 15.1

Fig. 15.2

### 15.2.1 Installation preparations

Bearings should be fitted in a clean, dry work area. Especially for small and miniature bearings, a "clean room" should be provided as any contamination particles in the bearing will greatly affect bearing efficiency.

All dirt, burrs or metal filings must be removed from the shaft, housing and tools used for mounting the bearings. Shaft and housing fitting surfaces should also be checked for roughness, dimensional and design accuracy, and to ensure that they are within allowable tolerance limits.

Bearings should not be unwrapped until just prior to installation. Normally, bearings to be used with grease lubricant can be installed as is, without removing the rust prevent oil. However, for bearings which will use oil lubricant, or in cases where mixing the grease and rust prevent oil would result in loss of lubrication efficiency, the rust prevent oil should be removed by washing with benzene or petroleum solvent and dried before installation. Bearings should also be washed and dried before installation if the package has been damaged or there are other chances that the bearings have been contaminated. **Double shielded bearings and sealed bearings should never be washed.**

### 15.2.2 Installing cylindrical bore bearings

For bearings with relatively small interference, the entire circumference of the raceway can be uniformly press-fit at room temperature as shown in **Fig. 15.3**. Usually, bearings are installed by striking the sleeve with a hammer; however, when installing a large number of bearings, a mechanical or hydraulic press should be used.

When installing non-separable bearings on a shaft and in a housing simultaneously, a pad which distributes the fitting pressure evenly over the inner and outer rings is used as shown in **Fig. 15.4**. If the fitting is too tight or bearing size is large, a considerable amount of force is required to install the bearing at room temperature. Installation can be facilitated by heating and expanding the inner ring beforehand. The required relative temperature difference between the inner ring and the shaft depends on the amount of interference and the shaft fitting surface diameter. **Fig. 15.5** shows the relation between the bearing inner bore diameter temperature differential and the amount of thermal expansion. **In any**

Fig. 15.3 Fitting sleeve pressure against inner ring

Fig. 15.4 Fitting sleeve pressure against inner /outer ring simultaneously

Fig. 15.5 Temperature required for heat-fitting inner ring

**event, bearings should never be heated above 120°C.**

The most commonly used method of heating bearings is to immerse them in hot oil. This method must not be used for sealed bearings or shield bearings with grease sealed inside.

To avoid overheating parts of the bearings they should never be brought into direct contact with the heat source, but instead should be suspended inside the heating tank or placed on a wire grid.

If heating the bearing with air in a device such as a thermostatic chamber, the bearing can be handled while dry.

For heating the inner rings of NU, NJ or NUP cylindrical and similar type bearings without any ribs or with only a single rib, an induction heater can be used to quickly heat bearings in a dry state (**must demagnetize**).

**When heated bearings are installed on shafts, the inner rings must be held against the shaft abutment until the bearing has been cooled in order to prevent clearance between the ring and the abutment face.**

As shown in Fig. 15.6, a removal pawl, or tool, can also be used to dismount the inner ring when using the induction heating method described above.

**15.2.3 Installation of tapered bore bearings**

Small type bearings with tapered bores are installed over a tapered shaft, withdrawal sleeves, or adapter sleeves by driving the bearing into place using a locknut. The locknut is tightened using a hammer or impact wrench. (Fig. 15.7)

Large size bearings require considerable fitting force and must be installed hydraulically.

In Fig. 15.8 the fitting surface friction and nut tightening torque needed to install bearings with tapered bores directly onto tapered shafts are decreased by injecting

Fig. 15.6 Removal of inner ring using an induction heater

Fig. 15.7 Installation methods using locknuts

Fig. 15.8 Installation utilizing oil injection

Fig. 15.9 Installation using hydraulic nut

high pressure oil between the fitting surfaces.

**Fig. 15.9 a)** shows one method of installation where a hydraulic nut is used to drive the bearing onto a tapered shaft.

**Fig. 15.9 b) and c)** show installation using a hydraulic nut with adapter sleeves and withdrawal sleeves.

**Fig. 15.10** shows an installation method using a hydraulic withdrawal sleeve.

With tapered bore bearings, as the inner ring is driven axially onto the shaft or adapter or withdrawal sleeve, the interference will increase and the bearing internal radial clearance will decrease. Interference can be estimated by measuring decrease in internal radial clearance. As shown in **Fig. 15.11**, the internal radial clearance between the rollers and outer ring of spherical roller bearings should be measured with a thickness gauge under no load while the rollers are held in the correct position. Instead of using the decrease in amount of internal radial clearance to estimate the interference, it is possible to estimate by measuring the distance the bearing has been driven onto the shaft.

For spherical roller bearings, **Table 15.1** indicates the appropriate interference which will be achieved as a result of the internal radial clearance decrease, or the distance the bearing has been driven onto the shaft.

For conditions such as heavy loads, high speeds, or when there is a large temperature differential between the inner and outer rings, etc. which require large interference fits, bearings which have a minimum internal radial clearance of C3 or greater should be used. **Table 15.1** lists the maximum values for internal radial clearance

Fig. 15.10 Installation using hydraulic withdrawal sleeve

Fig. 15.11 Internal clearance measurement method for spherical roller bearings

decrease and axial displacement. For these applications, the remaining clearance must be greater than the minimum allowable residual clearance listed in **Table 15.1**.

### 15.2.4 Installation of outer ring

Even for tight interference fits, the outer rings of small type bearings can be installed by driving them into housings at room temperature. For large interference type bearings, the housing can be heated before installing the bearing, or the bearing's outer ring can be cooled with dry ice, etc. before installing. If dry ice or other cooling agent is used, atmospheric moisture will condense on bearing surfaces, and therefore appropriate rust preventative measures are necessary.

### 15.3 Internal clearance adjustment

As shown in **Fig. 15.12**, for angular contact ball bearings and tapered roller bearings the desired amount of axial internal clearance can be set at the time of installation by tightening or loosening the adjustment nut.

To adjust the suitable axial internal clearance or amount of bearing preload, the internal clearance can be measured while tightening the adjusting nut as shown in **Fig. 15.13**. Other methods are to check rotation torque by rotating the shaft or housing while adjusting the nut, or to insert shims of the proper thickness as shown in **Fig. 15.14**.

**Table 15.1 Installation of tapered bore spherical roller bearings**

## 15.4 Post installation running test

To insure that the bearing has been properly installed, a running test is performed after installation is completed. The shaft or housing is first rotated by hand and if no problems are observed low speed, no load power test is performed. If no abnormalities are observed, **the load and speed are gradually increased to operating conditions. During the test if any unusual noise, vibration, or temperature rise is observed the test should be stopped and examine the equipment. If necessary, the bearing should be disassembled for inspection.**

To check bearing running noise, the sound can be amplified and the type of noise ascertained with a listening instrument placed against the housing. A clear, smooth and continuous running sound is normal. A high, metallic or irregular sound indicates some error in function. Vibration can be accurately checked with a vibration measuring instrument, and the amplitude and frequency characteristics measured quantitatively.

Usually the bearing temperature can be estimated from the housing surface temperature. However, if the bearing outer ring is accessible through oil inlets, etc., the temperature can be more accurately measured.

Under normal conditions, bearing temperature rises with operation time and then reaches a stable operating temperature after a certain period of time. If the temperature does not stable and continues to rise, or if there is a sudden temperature rise, or if the temperature is extremely high, the bearing should be inspected.

## 15.5 Bearing disassembly

Bearings are often removed as part of periodic inspection procedures or during the replacement of other parts. However, the shaft and housing are almost always reinstalled, and in more than a few cases the bearings themselves are reused. These bearings, shafts, housings, and other related parts must be designed to prevent damage during disassembly procedures, and the proper disassembly tools must be employed. When removing raceways with interference, pulling force should be applied to the raceway only. **Do not remove the raceway through the rolling elements.**

### 15.5.1 Disassembly of bearings with cylindrical bores

For small type bearings, the pullers shown in **Fig. 15.15 a) and b)** or the press method shown in **Fig. 15.16** can be used for disassembly. When used properly, these methods can improve disassembly efficiency and prevent damage to bearings.

To facilitate disassembly procedures, attention should be given to planning the designs of shafts and housings, such as providing extraction grooves on the shaft and housing for puller claws as shown **Figs. 15.17 and 15.18**. Threaded bolt holes should also be provided in housings to facilitate the pressing out of outer rings as shown in **Fig. 15.19**.

Fig. 15.15 Puller disassembly

Fig. 15.16 Press disassembly

Fig. 15.17 Extracting grooves

Fig. 15.18 Extraction groove for outer ring disassembly

Large bearings, installed with tight fits, and having been in service for a long period of time, will likely have developed fretting corrosion on fitting surfaces and will require considerable dismounting force. In such instances, dismounting friction can be reduced by injecting oil under high pressure between the shaft and inner ring surfaces as shown in **Fig. 15.20**.

For NU, NJ and NUP type cylindrical roller bearings, the induction heating unit shown in **Fig. 15.6** can be used to facilitate removal of the inner ring by means of thermal expansion. This method is highly efficient for frequent disassembly of bearings with identical dimensions.

**Fig. 15.19** Outer ring disassembly bolt

### 15.5.2 Disassembly of bearings with tapered bores

Small bearings installed using an adapter are removed by loosening the locknut, placing a block on the edge of the inner ring as shown in **Fig. 15.21**, and tapping with a hammer. Bearings which have been installed with withdrawal sleeves can be disassembled by tightening down the lock nut as shown in **Fig. 15.22**.

For large type bearings on tapered shafts, adapters, or withdrawal sleeves, disassembly is greatly facilitated by hydraulic methods. **Fig. 15.23** shows the case where the bearing is removed by applying hydraulic pressure on the fitting surface of a bearing installed on a tapered shaft.

**Fig. 15.21** Disassembly of bearing with adapter

**Fig. 15.20** Removal by hydraulic pressure

**Fig. 15.22** Disassembly of bearing with withdrawal sleeve

**Fig. 15.23** Removal of bearing by hydraulic pressure

Fig. 15.24 shows two methods of disassembling bearings with adapters or withdrawal sleeves using a hydraulic nut. Fig. 15.25 shows a disassembly method using a hydraulic withdrawal sleeve where high pressure oil is injected between fitting surfaces and a nut is then employed to remove the sleeve.

Fig. 15.24 Disassembly using hydraulic nut

Fig. 15.25 Disassembly using hydraulic withdrawal sleeve

## 15.6 Bearing maintenance and inspection

In order to get the use the bearing to its full potential and keep it in good working condition as long as possible, maintenance and inspections should be performed. Doing so will enable early detection of any problems with the bearing.

This will enable you to prevent bearing failure before it happens, and will enhance productivity and cost performance.

The following measures are often taken as a general method of maintaining and managing bearings.

Maintenance management requires inspection items and frequency for performing routine inspections be determined according to the importance of the device or machine.

### 15.6.1 Inspection of machine while running

The interval for replenishing and replacing lubricant is determined by a study of lubricant nature and checking the bearing temperature, noise and vibration.

### 15.6.2 Observation of bearing after use

Take note of any problem that may appear after the bearing is used or when performing routine inspections, and take measures for preventing reoccurrence of any damage discovered. For types of bearing damage and countermeasures for preventing damage, see section 16.

## 16. Bearing Damage and Corrective Measures

If handled correctly, bearings can generally be used for a long time before reaching their fatigue life. If damage occurs prematurely, the problem could stem from improper bearing selection, handling or lubrication. In this occurs, take note of the type of machine on which the bearings is used, the place where it is mounted, service

conditions and surrounding structure. By investigating several possible causes surmised from the type of damage and condition at the time the damage occurred, it is possible to prevent the same kind of damage from reoccurring. **Table 16.1** gives the main causes of bearing damage and remedies for correcting the problem.

**Table 16.1 Bearing damage, main causes of bearing damage and remedies for correcting the problem**

Description		
<p><b>Flaking</b></p> <p>Surface of the raceway and rolling elements peels away in flakes Conspicuous hills and valleys form soon afterward.</p> 	<p><b>Causes</b></p> <ul style="list-style-type: none"> <li>• Excessive load, fatigue life, improper handling</li> <li>• Improper mounting.</li> <li>• Improper precision in the shaft or housing.</li> <li>• Insufficient clearance.</li> <li>• Contamination.</li> <li>• Rust.</li> <li>• Improper lubrication</li> <li>• Drop in hardness due to abnormally high temperatures.</li> </ul> <p><b>Correction</b></p> <ul style="list-style-type: none"> <li>• Select a different type of bearing.</li> <li>• Reevaluate the clearance.</li> <li>• Improve the precision of the shaft and housing.</li> <li>• Review application conditions.</li> <li>• Improve assembly method and handling.</li> <li>• Reevaluate the layout (design) of the area around the bearing.</li> <li>• Review lubricant type and lubrication methods.</li> </ul>	
<p><b>Seizure</b></p> <p>The bearing heats up and becomes discolored. Eventually the bearing will seize up.</p> 	<p><b>Causes</b></p> <ul style="list-style-type: none"> <li>• Insufficient clearance (including clearances made smaller by local deformation).</li> <li>• Insufficient lubrication or improper lubricant.</li> <li>• Excessive loads (excessive preload).</li> <li>• Skewed rollers.</li> <li>• Reduction in hardness due to abnormal temperature rise</li> </ul> <p><b>Correction</b></p> <ul style="list-style-type: none"> <li>• Riview lubricant type and quantity.</li> <li>• Check for proper clearance. <p><b>Cracking and notching</b></p> <p>Localized flaking occurs. Little cracks or notches appear.</p> 	<p><b>Causes</b></p> <ul style="list-style-type: none"> <li>• Excessive shock loads.</li> <li>• Improper handling (use of steel hammer, cutting by large particles of foreign matter)</li> <li>• Formation of decomposed surface layer due to improper lubrication</li> <li>• Excessive interference.</li> <li>• Large flaking.</li> <li>• Friction cracking.</li> <li>• Imprecision of mounting mate (oversized fillet radius)</li> </ul> <p><b>Correction</b></p> <ul style="list-style-type: none"> <li>• Review lubricant (friction crack prevention).</li> <li>• Select proper interference and review materials.</li> <li>• Review service conditions.</li> <li>• Improve assembly procedures and take more care in handling.</li> </ul>	

Table 16.1 Bearing damage, main causes of bearing damage and remedies for correcting the problem

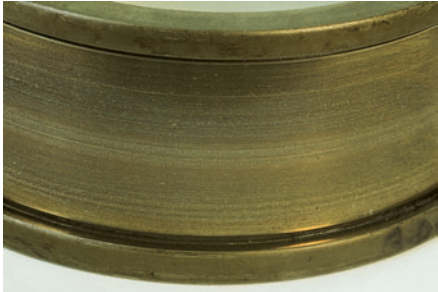

Description		
<b>Cage damage</b> Rivets break or become loose resulting in cage damage.		<b>Causes</b> <ul style="list-style-type: none"> <li>Excessive moment loading.</li> <li>High speed or excessive speed fluctuations.</li> <li>Inadequate lubrication.</li> <li>Impact with foreign objects.</li> <li>Excessive vibration.</li> <li>Improper mounting. (Mounted misaligned)</li> </ul>
		<b>Correction</b> <ul style="list-style-type: none"> <li>Reevaluation of lubrication conditions.</li> <li>Review of cage type selection.</li> <li>Investigate shaft and housing rigidity.</li> <li>Review service conditions.</li> <li>Improve assembly method and handling.</li> </ul>
<b>Rolling path skewing</b> Abrasion or an irregular, rolling path skewing left by rolling elements along raceway surfaces.		<b>Causes</b> <ul style="list-style-type: none"> <li>Shaft or housing of insufficient accuracy.</li> <li>Improper installation.</li> <li>Insufficient shaft or housing rigidity.</li> <li>Shaft whirling caused by excessive internal bearing clearances.</li> </ul>
		<b>Correction</b> <ul style="list-style-type: none"> <li>Reinspect bearing's internal clearances.</li> <li>Review accuracy of shaft and housing finish.</li> <li>Review rigidity of shaft and housing.</li> </ul>
<b>Smearing and scuffing</b> The surface becomes rough and some small deposits form. Scuffing generally refers to roughness on the race collar and the ends of the rollers.		<b>Causes</b> <ul style="list-style-type: none"> <li>Inadequate lubrication.</li> <li>Entrapped foreign particles.</li> <li>Roller skewing due to a misaligned bearing.</li> <li>Bare spots in the collar oil film due to large axial loading.</li> <li>Surface roughness.</li> <li>Excessive slippage of the rolling elements.</li> </ul>
		<b>Correction</b> <ul style="list-style-type: none"> <li>Reevaluation of the lubricant type and lubrication method.</li> <li>Bolster sealing performance.</li> <li>Review preload.</li> <li>Review service conditions.</li> <li>Improve assembly method and handling</li> </ul>
<b>Rust and corrosion</b> The surface becomes either partially or fully rusted, and occasionally rust even occurs along the rolling element pitch lines.		<b>Causes</b> <ul style="list-style-type: none"> <li>Poor storage conditions.</li> <li>Poor packaging.</li> <li>Insufficient rust inhibitor.</li> <li>Penetration by water, acid, etc.</li> <li>Handling with bare hands.</li> </ul>
		<b>Correction</b> <ul style="list-style-type: none"> <li>Take measures to prevent rusting while in storage.</li> <li>Periodically inspect the lubricating oil.</li> <li>Improve sealing performance.</li> <li>Improve assembly method and handling.</li> </ul>

Table 16.1 Bearing damage, main causes of bearing damage and remedies for correcting the problem

Description		
<b>Fretting</b>	There are two types of fretting. In one, a rusty wear powder forms on the mating surfaces. In the other, brinelling indentations form on the raceway at the rolling element pitch.	<div style="display: flex; flex-direction: column;"> <div style="background-color: #d3d3d3; padding: 5px; writing-mode: vertical-rl; transform: rotate(180deg);">Causes</div> <ul style="list-style-type: none"> <li>● Insufficient interference.</li> <li>● Small bearing oscillation angle.</li> <li>● Insufficient lubrication.(unlubricated)</li> <li>● Fluctuating loads.</li> <li>● Vibration during transport, vibration while stopped.</li> </ul> <hr/> <div style="background-color: #d3d3d3; padding: 5px; writing-mode: vertical-rl; transform: rotate(180deg);">Correction</div> <ul style="list-style-type: none"> <li>● Select a different kind of bearing.</li> <li>● Select a different type of lubricant.</li> <li>● Review the interference and apply a coat of lubricant to fitting surface.</li> <li>● Pack the inner and outer rings separately for transport.</li> </ul> </div>
<b>Wear</b>	The surfaces wear and dimensional deformation results. Wear is often accompanied by roughness and scratches.	<div style="display: flex; flex-direction: column;"> <div style="background-color: #d3d3d3; padding: 5px; writing-mode: vertical-rl; transform: rotate(180deg);">Causes</div> <ul style="list-style-type: none"> <li>● Entrapment of foreign particles in the lubricant.</li> <li>● Inadequate lubrication.</li> <li>● Skewed rollers.</li> </ul> <hr/> <div style="background-color: #d3d3d3; padding: 5px; writing-mode: vertical-rl; transform: rotate(180deg);">Correction</div> <ul style="list-style-type: none"> <li>● Review lubricant type and lubrication methods.</li> <li>● Improve sealing performance.</li> <li>● Take steps to prevent misalignment.</li> </ul> </div>
<b>Electrolytic corrosion</b>	Pits form on the raceway. The pits gradually grow into ripples.	<div style="display: flex; flex-direction: column;"> <div style="background-color: #d3d3d3; padding: 5px; writing-mode: vertical-rl; transform: rotate(180deg);">Causes</div> <ul style="list-style-type: none"> <li>● Electric current flowing through the rollers.</li> </ul> <hr/> <div style="background-color: #d3d3d3; padding: 5px; writing-mode: vertical-rl; transform: rotate(180deg);">Correction</div> <ul style="list-style-type: none"> <li>● Create a bypass circuit for the current.</li> <li>● Insulate the bearing.</li> </ul> </div>
<b>Dents and scratches</b>	Scoring during assembly, gouges due to hard foreign objects, and surface denting due to mechanical shock.	<div style="display: flex; flex-direction: column;"> <div style="background-color: #d3d3d3; padding: 5px; writing-mode: vertical-rl; transform: rotate(180deg);">Causes</div> <ul style="list-style-type: none"> <li>● Entrapment of foreign objects.</li> <li>● Bite-in on the flaked-off side.</li> <li>● Dropping or other mechanical shocks due to careless handling.</li> <li>● Assembled misaligned.</li> </ul> <hr/> <div style="background-color: #d3d3d3; padding: 5px; writing-mode: vertical-rl; transform: rotate(180deg);">Correction</div> <ul style="list-style-type: none"> <li>● Improve handling and assembly methods.</li> <li>● Bolster sealing performance. (measures for preventing foreign matter from getting in)</li> <li>● Check area surrounding bearing. (when caused by metal fragments)</li> </ul> </div>

Table 16.1 Bearing damage, main causes of bearing damage and remedies for correcting the problem

Description		
<b>Creeping</b>	Surface becomes mirrored by sliding of inside and outside diameter surfaces. May be accompanied by discoloration or score.	<div style="display: flex; flex-direction: column;"> <div style="background-color: #d3d3d3; padding: 5px; writing-mode: vertical-rl; transform: rotate(180deg);">Causes</div> <ul style="list-style-type: none"> <li>● Insufficient interference in the mating section.</li> <li>● Sleeve not fastened down properly.</li> <li>● Abnormal temperature rise.</li> <li>● Excessive loads.</li> </ul> <hr/> <div style="background-color: #d3d3d3; padding: 5px; writing-mode: vertical-rl; transform: rotate(180deg);">Correction</div> <ul style="list-style-type: none"> <li>● Reevaluate the interference.</li> <li>● Reevaluate usage conditions.</li> <li>● Review the precision of the shaft and housing.</li> <li>● Raceway end panel scuffing</li> </ul> </div>
		
<b>Speckles and discoloration</b>	Luster of raceway surfaces is gone; surface is matted, rough, and / or evenly dimpled. Surface covered with minute dents.	<div style="display: flex; flex-direction: column;"> <div style="background-color: #d3d3d3; padding: 5px; writing-mode: vertical-rl; transform: rotate(180deg);">Causes</div> <ul style="list-style-type: none"> <li>● Infiltration of bearing by foreign matter.</li> <li>● Insufficient lubrication.</li> </ul> <hr/> <div style="background-color: #d3d3d3; padding: 5px; writing-mode: vertical-rl; transform: rotate(180deg);">Correction</div> <ul style="list-style-type: none"> <li>● Reevaluation of lubricant type and lubrication method.</li> <li>● Review sealing mechanisms.</li> <li>● Examine lubrication oil purity. (filter may be excessively dirty, etc.)</li> </ul> </div>
		
<b>Peeling</b>	Patches of minute flaking or peeling (size, approx. 10 μm). Innumerable hair-line cracks visible though not yet peeling. (This type of damage frequently seen on roller bearings.)	<div style="display: flex; flex-direction: column;"> <div style="background-color: #d3d3d3; padding: 5px; writing-mode: vertical-rl; transform: rotate(180deg);">Causes</div> <ul style="list-style-type: none"> <li>● Infiltration of bearing by foreign matter.</li> <li>● Insufficient lubrication.</li> </ul> <hr/> <div style="background-color: #d3d3d3; padding: 5px; writing-mode: vertical-rl; transform: rotate(180deg);">Correction</div> <ul style="list-style-type: none"> <li>● Reevaluation of lubricant type and lubrication method.</li> <li>● Improve sealing performance. (to prevent infiltration of foreign matter)</li> <li>● Take care to operate smoothly.</li> </ul> </div>

17.4 Allowable axial load for ball bearings

Fig. 17.4.1 Allowable axial load for deep groove ball bearings

Fig. 17.4.2 Allowable axial load for angular contact ball bearings

Note: When an axial load acts upon deep groove or angular contact ball bearings, allowable axial load is the load whereby the contact ellipse exceeds the shoulder of the raceway.

Note: Values when bearing and housing are rigid bodies.  
Axial displacement may become large depending on shape of shaft/housing and fitting conditions.

17.5 Fitting surface pressure

Table 17.5.1 lists equations for calculating the pressure and maximum stress between fitting surfaces.

Table 17.5.2 can be used to determine the approximate average groove diameter for bearing inner and outer rings.

The effective interference, in other words the actual interference  $\Delta_{def}$  after fitting, is smaller than the apparent

interference  $\Delta d$  derived from the measured value for the bearing bore diameter and shaft. This difference is due to the roughness or variations of the finished surfaces to be fitted, and therefore it is necessary to assume the following reductions in effective interference:

- For ground shafts: 1.0 ~ 2.5  $\mu\text{m}$
- For lathed shafts : 5.0 ~ 7.0  $\mu\text{m}$

Table 17.5.1 Fitting surface pressure and maximum stress

Fit conditions		Equation	Codes (units: N {kgf} , mm)
Fitting surface pressure  MPa {kgf / mm <sup>2</sup> }	Solid steel shaft/ inner ring fit	$P = \frac{E}{2} \frac{\Delta_{def}}{d} \left[ 1 - \left( \frac{d}{D_i} \right)^2 \right]$	$d$ : Shaft diameter, inner ring bore diameter $d_o$ : Hollow shaft inner diameter $D_i$ : Inner ring average groove diameter $\Delta_{def}$ : Effective interference $E$ : Elasticity factor = 208,000 MPa { 21,200 kgf / mm <sup>2</sup> }
	Hollow steel shaft/ inner ring fit	$P = \frac{E}{2} \frac{\Delta_{def}}{\Delta d} \frac{[1 - (d / D_i)^2] [1 - (d_o / d)^2]}{[1 - (d_o / D_i)^2]}$	
	Steel housing/ outer ring fit	$P = \frac{E}{2} \frac{\Delta_{Def}}{D} \frac{[1 - (D_o / D)^2] [1 - (D / D_h)^2]}{[1 - (D_o / D_h)^2]}$	$D$ : Housing inner diameter, bearing outer diameter $D_o$ : Outer ring average groove diameter $D_h$ : Housing outer diameter $\Delta_{Def}$ : Effective interference
Maximum stress	Shaft / inner ring fit	$\sigma_{t \max} = P \frac{1 + (d / D_i)^2}{1 - (d / D_i)^2}$	Inner ring bore diameter face maximum tangential stress
MPa {kgf / mm <sup>2</sup> }	Housing/ outer ring fit	$\sigma_{t \max} = P \frac{2}{1 - (D_o / D)^2}$	Outer ring inner diameter face maximum tangential stress

Table 17.5.2 Average groove diameter (approximate expression)

Bearing type		Average groove diameter	
		Inner ring ( $D_i$ )	Outer ring ( $D_o$ )
Deep groove ball bearings	All types	1.05 $\frac{4d + D}{5}$	0.95 $\frac{d + 4D}{5}$
Cylindrical roller bearings <sup>①</sup>	All types	1.05 $\frac{3d + D}{4}$	0.98 $\frac{d + 3D}{4}$
Spherical roller bearings	All types	$\frac{2d + D}{3}$	0.97 $\frac{d + 4D}{5}$

$d$ : Inner ring bore diameter mm     $D$ : Outer ring outer diameter mm

① Average groove diameter values shown for double-flange type.

Fig. 17.5.1 Average fit interference as it relates to surface pressure  $P_m$  and max. stress  $\sigma_{t \max}$

Fig. 17.5.2 Maximum fit interference as it relates to surface pressure  $P_m$  and max. stress  $\sigma_{t \max}$

### 17.6 Necessary press fit and pullout force

Equations (17.1) and (17.2) below can be used to calculate the necessary pullout force for press fit for inner rings and shafts or outer rings and housings.

For shaft and inner rings:

$$K_d = \mu \cdot P \cdot \pi \cdot d \cdot B \dots\dots\dots(17.1)$$

For housing and outer rings:

$$K_D = \mu \cdot P \cdot \pi \cdot D \cdot B \dots\dots\dots(17.2)$$

Where,

$K_d$  : Inner ring press fit or pullout force N {kgf}

$K_D$  : Outer ring press fit or pullout force N {kgf}

$P$  : Fitting surface pressure MPa {kgf/mm²}

(Refer to **Table 17.5.1**)

$d$  : Shaft diameter, inner ring bore diameter mm

$D$  : Housing inner diameter, outer ring outer diameter mm

$B$  : Inner or outer ring width

$\mu$  : Sliding friction coefficient (Refer to **Table 17.6.1**)

Table 17.6.1 Press fit and pullout sliding friction coefficient

Type	$\mu$
Inner (outer) ring press fit onto cylindrical shaft (bore)	0.12
Inner (outer) ring pullout from cylindrical shaft (bore)	0.18
Inner ring press fit onto tapered shaft or sleeve	0.17
Inner ring pullout from tapered shaft	0.14
Sleeve press fit onto shaft/bearing	0.30
Sleeve pullout from shaft/bearing	0.33

① For recommended fitting, see page A-50.

## 1. Design features and special characteristics

Deep groove ball bearings are very widely used. A deep groove is formed on each inner and outer ring of the bearing enabling them to sustain radial and axial loads in either direction as well as the complex loads which result from the combination of these forces. Deep groove ball bearings are suitable for high speed applications.

In addition to unsealed bearings, deep groove ball bearings include ball bearings with greased sealed inside (sealed or shielded) and bearings with a snap ring that simplify structure around the bearing and design.

**Table 1** shows the construction and special characteristics of various sealed deep groove ball bearings.

**Table 1 Sealed ball bearings: construction and characteristics**

Type, code no.	Shielded type	Sealed type			
	Non-contact type ZZ	Non-contact type LLB	Contact type LLU	Low torque type LLH	
Construction					
	<ul style="list-style-type: none"> <li>• Metal shield plate is affixed to outside ring; inner ring incorporates a V-groove and labyrinth clearance.</li> </ul>	<ul style="list-style-type: none"> <li>• Outer ring incorporates synthetic rubber molded to a steel plate; seal edge is aligned with V-groove along inner ring surface with labyrinth clearance.</li> </ul>	<ul style="list-style-type: none"> <li>• Outer ring incorporates synthetic rubber molded to a steel plate; seal edge contacts V-groove along inner ring surface.</li> </ul>	<ul style="list-style-type: none"> <li>• Basic construction the same as LU type, but specially designed lip on edge of seal prevents penetration by foreign matter; low torque construction.</li> </ul>	
Performance comparison	<b>Torque</b>	Low	Low	Rather high	Medium
	<b>Dust proofing</b>	Very good	Better than ZZ-type	Excellent	Much better than LLB-type
	<b>Water proofing</b>	Poor	Poor	Very good	Very good
	<b>High speed capacity</b>	Same as open type	Same as open type	Limited by contact seals	Much better than LLU-type
	<b>Allowable temp.range</b> ①	Depends on lubricant	-25 °C ~ 120 °C	-25 °C ~ 110 °C	-25 °C ~ 120 °C

① Please consult NTN Engineering about applications which exceed the allowable temperature range of products listed on this table.  
 Note : This chart lists double shielded and double sealed bearings, but single shielded (Z) and single sealed (LB, LU, LH) are also available.  
 Grease lubrication should be used with single shielded and single sealed bearings.

## 2. Standard cage types

As shown in **Table 2**, pressed cages are generally used in deep groove ball bearings. Machined cages are however used for large bearings and high-speed bearings.

**Table 2 Standard cage for deep groove ball bearings**

Bearing series	Pressed cages	Machined cages

63	6300~ 6344	—
64	6403~ 6416	—

## 3. Other bearing types

### 3.1 Bearings with snap rings

Some bearings accommodate a snap ring which is attached along the outer diameter of the outer ring. By using snap rings, positioning in the axial direction is possible and housing installation is simplified. In addition to open type, shielded and sealed types are also manufactured. Consult NTN Engineering.

### 3.2 Expansion compensating bearings (creep prevention bearings)

The boundary dimensions of expansion compensating deep groove ball bearings are the same as for standard bearings, but formed high polymer material with a high expansion rate is provided in the grooves on the outer circumference of the outer ring (see **Diagram 1**).

Due to the extremely small difference of thermal expansion attained between the fitted surfaces of the high polymer equipped outer ring and the light alloy bearing housing, a good interference fit can be achieved with stable performance across a wide temperature range. Another

**Diagram 1. Expansion compensating bearings**

advantage is a large reduction in the occurrence of outer ring creeping.

#### (1) Allowable load

Maximum allowable load  $C_p$  (refer to the table of boundary dimensions) has been determined in accordance with outer ring strength; therefore, **it is necessary to select a bearing with a maximum allowable load greater than the largest anticipated bearing load.**

#### (2) Housing and bearing fit

**Table 3** shows the recommended fits for bearings with light metal alloy housings.

In cases where the bearing is going to be interference fit with the housing, it is very important not to damage the high polymer material. Therefore it is essential that the lip of the housing diameter be given a  $10^\circ\text{--}15^\circ$  chamfer as shown in **Diagram 2**.

Furthermore, as shown in **Diagram 2**, it is also advisable to apply the interference fit using a press in order not force the bearing into the housing in a misaligned position. (**Diagram 2**)

#### (3) Radial internal clearance

Regulations for radial internal clearance are the same as those for standard deep groove ball bearings. For standard fit and application conditions, a C3 clearance is used with

**Table 3 Recommended fits for outer ring and housing bore**

Conditions		Suitable bearing	Housing bore tolerance class
Load type, etc.	Housing material		
Rotating outer ring load Rotating inner ring load; light load Direction indeterminate load; ordinary load	Al alloy Mg alloy Other light alloys	Deep groove ball bearing  Cylindrical roller bearing	H6
Rotating outer ring load; heavy load Direction indeterminate load; shock load	Al alloy Mg alloy Other light alloys	Thick-walled type deep groove ball bearing	N6

**Diagram 2. Fitting method and housing inner diameter chamfer**

this bearing.

For more detailed information concerning this bearing and the availability of roller bearings contact NTN Engineering.

#### (4) Allowable temperature range

-20 ~ 120°C

### 3.3 Long-life bearings (TMB/TAB bearings)

Boundary dimensions of long-life bearings are the same as those of standard deep groove ball bearings, but the bearings have undergone special heat treatment that considerably extends wear life.

These bearings are especially effective in countering reduced wear life due to the effects of infiltration by dust and other foreign matter.

Features are as follows:

- Rated load is the same as standard bearings, but shaft characteristics factor is  $a_2 = 2.2$  for TMB bearings and  $a_2 = 3.6$  for TAB.
- TMB 62 series bearings can be used in place of standard 63 series bearings enabling lighter weight, more compact designs
- Greater resistance to reduced wear life due to infiltration by dust and other foreign matter

Dimensions for these bearings are not provided in the dimensions table. For details, please contact NTN Engineering.

### 3.4 AC bearings (creep prevention bearings)

AC bearings have the same boundary dimensions as standard bearings with the addition of two O-rings imbedded

Diagram 3. AC bearing

in the outside circumference of the outer ring. (Diagram 3)

This bearing has a steel housing, can withstand rotating outer ring loads, and is suitable for applications where a "tight fit" is not possible but the fear of creeping exists. With its capacity for axial load displacement, an AC bearing can also be installed as a floating side bearing to accommodate shaft fluctuations. Before installing the bearing into the housing, high viscosity oil (base oil viscosity, 100 mm<sup>2</sup>/s or more) or grease should be applied to the space between the two O-rings. This lubricant forms a thin oil layer inside the bearing which prevents contact between the outer ring and housing, lowers the coefficient of friction, and is still able to prevent creeping by utilizing the friction force of the O-rings. Outer ring spin is prevented by friction force of the O-ring and housing.

For dimensional specifications, handling procedures, and other detailed information concerning AC bearings, contact NTN Engineering.

#### (1) Allowable load

Because allowable load  $C_p$  that takes outer ring strength into account (see dimensions table) is established, selection must be made so that maximum load on the bearing does not exceed  $C_p$ .

#### (2) Fit with housing

Table 4 gives recommended fit with steel housing.

Diagram 4. Housing

Table 4 dimensions and shape

Housing bore tolerance	G7
Housing bore entrance chamfer	Max. 30°
Housing bore chamfer grinding undercut	Min. 0.006D
Housing bore finish roughness	2.5 μm Ra
Housing bore roundness	1/2 bearing housing dimension tolerance

#### (3) Allowable temperature range

2) Sealed and shielded bearings are also available.

3) This dimension applies to sealed and shielded bearings.

4) Does not include bearings with snap rings.

3) This dimension applies to sealed and shielded bearings.

## 1. Design features and special characteristics

The dimensional range of miniature and extra small ball bearings is given in **Table 1**. Boundary dimensions for both metric and inch systems are in accordance with the internationally specified ISO and ANSI/ABMA standards. The most widely used sealed and shielded type ball bearings have a 1–2 mm wider width dimension than open type bearings.

The main variations of these bearings are shown in **Table 2**. Bearings with snap rings, which simplify the bearing housing construction and design, have also been serialized and are listed in dimension tables. Among the most generally used sealed and shielded bearings are standard ZZ and ZZA type which incorporate non-contact steel shield plates. **Diagram 1** also shows non-contact type rubber sealed LLB and resin sealed SSA type bearings, and the contact-type rubber sealed LLU bearing.

**Table 1 Dimensional range**

Bearing	Dimensional range
Miniature ball bearings	Nominal outer diameter $D < 9\text{mm}$
Extra small ball bearings	Nominal bore diameter $d < 10\text{mm}$ Nominal outer diameter $D \geq 9\text{mm}$

**Diagram 1.**

**Table 2 Main types and construction**

Type	Standard type code			Flange-attached type code		
	Construction	Metric series	Inch series	Construction	Metric series	Inch series
Open type		6 BC	R		FL6 FLBC	FLR
Shielded type		6 x x ZZ W6 x x ZZ WBC x x x ZZ	RA x x ZZ		FL6 x x x ZZ FLW6 x x x ZZ FLWBC x x ZZ	FLRA x x ZZ

Note: 1. Representative type codes are shown. For further details, please refer to dimension tables.  
2. May change to ZA or SA for shielded type bearings, according to the bearing number.

## 2. Standard cage types

Pressed cage are standard for these bearings. However, molded resin cage are used for some bearings depending on the application.

## 3. Dimensional and rotational accuracy

The accuracy of miniature and extra small ball bearings complies with JIS standards. Accuracy standards are listed in the Bearings Tolerances clause on page A-35. Flange accuracies are listed in **Table 3**.

**Table 3 Tolerance and tolerance values for outer ring flange**

Units  $\mu\text{m}$

Accuracy class		Outer diameter dimensional tolerance		Outer ring surface runout for rear surface $S_{D1}$ Max.	Back face axial runout $S_{ea1}$ Max.	Width dimension tolerance		Width unevenness $V_{C1S}$ or $V_{C2S}$ Max.
		$\Delta D_{1S}$ or $\Delta D_{2S}$ Upper Lower				$\Delta C_{1S}$ or $\Delta C_{2S}$ Upper Lower		
ISO standard	Class 0	* (see table below)		—	—	Identical to same bearing's inner ring $V_{BS}$		Identical to same bearing's inner ring $V_{BS}$
	Class 6			—	—			
	Class 5			8	11			
	Class 4			4	7			
	Class 2			1.5	3 <sup>①</sup> 4			

① Nominal outer diameter, 18 mm or less.

\* Units  $\mu\text{m}$

Flange nominal outer diameter $D_1$ or $D_2$ mm		Outer diameter dimensional tolerance $\Delta D_{1S}$ or $\Delta D_{2S}$	
over	incl.	Upper	Lower
—	10	+220	-36
10	18	+270	-43
18	30	+330	-52
30	50	+390	-62

## 4. Radial internal clearance

Radial internal clearance values should be applied as listed in the table regarding the Bearing Internal Clearance and Preload clause on page A-58.

However, for miniature and extra small bearings, the radial clearance values for high precision bearings given in **Table 4**

are applied in many cases.

For more specific selection information, please refer to the **NTN Miniature and Extra Small Ball Bearings Catalog**, or contact **NTN Engineering**.

**Table 4 Radial internal clearance for high precision bearings**

Units  $\mu\text{m}$

MIL Standard	Tight				Standard						Loose		Extra Loose	
Code	C2S		CNS		CNM		CNL		C3S		C3M		C3L	
Internal clearance	Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.
	0	5	3	8	5	10	8	13	10	15	13	20	20	28

Note: 1. These standards are specified in accordance with MIL B-23063. However, NTN codes are shown.

2. Clearance values do not include compensation for measuring load.

## 1. Design features and special characteristics

### 1.1 Angular contact ball bearing

Angular contact ball bearings are non-separable bearings which have a certain contact angle in the radial direction relative to the straight line that runs through the point where each ball makes contact with the inner and outer rings (see **Diagram 1**). **Table 1** gives contact angle and contact angle symbol.

In addition to radial loads, single direction axial loads can also be accommodated by angular contact ball bearings.

Furthermore, since an axial load is generated from a radial force, these bearings are generally used in pairs facing each other. Standard type, high speed use type and ultra high speed varieties of angular contact ball bearings are available through NTN, and there are also many duplex varieties. A bearing accuracy of JIS Class 5 or higher is applied to duplex type angular contact ball bearings, and in many cases they are given a preload, in compliance with standard preload levels,

before being used in an application. **Table 2** shows information concerning angular contact ball bearings, and **Table 3** shows similar information for duplex angular contact ball bearings.

Diagram 1.

Table 1 Contact angle and contact angle codes

Contact angle	15°	30°	40°
Code	C	A <sup>①</sup>	B

① Contact angle symbol A is omitted.

Table 2 Angular contact ball bearing types and characteristics

Type	Design	Characteristics
Standard type		<ul style="list-style-type: none"> <li>Available in bearing series 79, 70, 72, 72B, 73, and 73B.</li> <li>Contact angles: 30° and 40° (with B) available.</li> <li>Standard bearing cage type differs depending on bearing no. (Refer to <b>Table 4</b>)</li> </ul>

Table 3 Duplex angular contact ball bearings — types and characteristics

Duplex type	Characteristics
Back-to-back duplex (DB)	<ul style="list-style-type: none"> <li>Can accommodate radial loads and axial loads in either direction.</li> <li>Has a large distance <math>l</math> between the acting load center of the bearing, and therefore a large momentary force load capacity.</li> <li>Allowable misalignment angle is small.</li> </ul>
Face-to-face duplex (DF)	<ul style="list-style-type: none"> <li>Can accommodate radial loads and axial loads in either direction.</li> <li>Has a smaller distance <math>l</math> between the acting load center of the bearing, and therefore a smaller momentary force load capacity.</li> <li>Has a larger allowable misalignment angle than back-to-back duplex type.</li> </ul>
Tandem duplex (DT)	<ul style="list-style-type: none"> <li>Can accommodate radial loads and single direction axial loads.</li> <li>Axial loads are received by both bearings as a set, and therefore heavy axial loads can be accommodated.</li> </ul>

Note: 1. Duplex bearings are manufactured in a set to specified clearance and preload values, therefore they must be assembled together with identically numbered bearings and not mixed with other arrangements.

2. Triplex arrangements of angular contact bearings are also available. Consult NTN Engineering for details.

## 1.2 Four-point angular contact ball bearings

Four-point angular contact ball bearings have a contact angle of  $30^\circ$  and inner rings which are separated in half. As shown in **Diagram 2**, when the inner and outer rings receive a radial load the ball bearings contact the inner and outer rings at four points. This construction enables a single bearing to accommodate axial loads from either direction, and when generally under a simple axial load or heavy axial load, the bearing functions in reliance on two contact points like ordinary bearings.

Diagram 2.

## 1.3 Double row angular contact ball bearings

The structure of double row angular contact ball bearings is designed by arranging two single row angular contact bearings back-to-back in duplex (DB) to form one united bearing with a contact angle of  $25^\circ$ .

These bearings are capable of accommodating radial loads, axial loads in either direction, and have a high capacity for momentary loads as well.

As shown in **Diagram 3**, sealed and shielded type double row angular contact ball bearings are also available. Standard loads vary from those of open type bearings.

Diagram 3.

### ■ Flush ground

"Flush ground" is the name given to the finishing method shown in **Diagram 4** where the offset of the front and back faces of the bearing are ground to the same value. By doing this, a stated clearance or preload value can be achieved by using bearings with identical codes for these values, in other words by combining either DB or DF series bearings. DT series bearings can also be used in various arrangements to achieve uniform load distribution.

All BNT type bearings are flush ground, but other angular contact ball bearing series are not. If it is necessary to flush grind any of these other bearings, please consult NTN Engineering.

Diagram 4.

## 2. Standard cage types

Table 4 lists the standard cage types for angular contact ball bearings.

Table 4 Standard cages for angular contact ball bearings

Type	Bearing series	Molded resin cage	Pressed cage	Machined cage
Standard	79	7904~7913	—	7914 ~7960
	70	7000~7024	—	7026 ~7040
	72	—	7200 ~7222	7224 ~7240
	73	—	7300 ~7322	7324 ~7340
	72B	—	7200B~7222B	7224B ~7240B
	73B	—	7300B~7322B	7324B ~7340B
4-point contact	QJ2	—	—	QJ208 ~QJ224
	QJ3	—	—	QJ306 ~QJ324
Double row	52	—	5200S~5217S	—
	53	—	5302S~5314S	—

Note: Due to the material characteristics of molded resin cages, use at application temperatures in excess of 120°C is not possible.

1) This value achieved with machined cages; when pressed cages are used, 80% of this value is acceptable.  
 2) Bearing numbers appended with the code "B" have a contact angle of 40°; bearings with this code have a contact angle of 30°.  
 3) Smallest allowable dimension for chamfer dimension r.

# Single and Duplex Angular Contact Ball Bearings

## Dynamic equivalent radial load

$$P_r = XF_r + YF_a$$

Contact angle	e	Single, DT				DB, DF			
		$F_a/F_r \leq e$		$F_a/F_r > e$		$F_a/F_r \leq e$		$F_a/F_r > e$	
		X	Y	X	Y	X	Y	X	Y
30°	0.80	1	0	0.39	0.76	1	0.78	0.63	1.24
40°	1.14	1	0	0.35	0.57	1	0.55	0.57	0.93

## Static equivalent radial load

$$P_{or} = X_0 F_r + Y_0 F_a$$

Contact angle	Single, DT		DB, DF	
	$X_0$	$Y_0$	$X_0$	$Y_0$
30°	0.5	0.33	1	0.66
40°	0.5	0.26	1	0.52

For single and DT arrangement,  
When  $P_{or} < F_r$  use  $P_{or} = F_r$

Note: For bearing series 79 and 70, inner rings are constructed with groove abutments on both sides. Therefore, the inner ring chamfer dimension  $r_1$  is identical to dimension  $r$ . Furthermore, the radius  $r_{1a}$  of the shaft corner roundness is likewise identical to  $r_a$ .

1) This value achieved with machined cages; when pressed cages are used, 80% of this value is acceptable.  
 2) Bearing numbers appended with the code "B" have a contact angle of 40°; bearings with this code have a contact angle of 30°.  
 3) Smallest allowable dimension for chamfer dimension  $r$  or  $r_1$ .

# Single and Duplex Angular Contact Ball Bearings

### Dynamic equivalent radial load

$$P_r = XF_r + YF_a$$

Contact angle	e	Single, DT				DB, DF			
		$F_a/F_r \leq e$		$F_a/F_r > e$		$F_a/F_r \leq e$		$F_a/F_r > e$	
		X	Y	X	Y	X	Y	X	Y
30°	0.80	1	0	0.39	0.76	1	0.78	0.63	1.24
40°	1.14	1	0	0.35	0.57	1	0.55	0.57	0.93

### Static equivalent radial load

$$P_{or} = X_o F_r + Y_o F_a$$

Contact angle	Single, DT		DB, DF	
	$X_o$	$Y_o$	$X_o$	$Y_o$
30°	0.5	0.33	1	0.66
40°	0.5	0.26	1	0.52

For single and DT arrangement,  
When  $P_{or} < F_r$  use  $P_{or} = F_r$

1) Smallest allowable dimension for chamfer dimension *r*.

Note: 1. These bearings are also manufactured with a slot in the chamfer section of the outer ring to stop whirling.

2. This bearing is widely used in applications where the only type of load is axial. When considering it for use where radial loads are applied, consult NTN Engineering.

## QJ type

**Dynamic equivalent axial load**  
 $P_a = F_a$   
**Static equivalent axial load**  
 $P_{0a} = F_a$

## 1. Design features and characteristics

The outer ring raceway of self-aligning ball bearings forms a spherical surface whose center is common to the bearing center. The inner ring of the bearing has two raceways. The balls, cage, and inner ring of these bearings are capable of a shifting in order to compensate for a certain degree of misalignment with the outer rings. As a result, the bearing is able to align itself and compensate for shaft / housing finishing unevenness, bearing fitting error, and other sources of misalignment as shown in **Diagram 1**.

However, since axial load capacity is limited, self-aligning ball bearings are not suitable for applications with heavy axial loads.

Furthermore, if an adapter is used on the tapered bore of the inner diameter, installation and disassembly are much simpler and for this reason adapters are often used on equipment with drive shafts.

Diagram 1.

## 2. Standard cage types

All bearing series are equipped with a pressed cage, except 2322S, which is equipped with a machined cage.

## 3. Ball protrusion

Bearings with part numbers listed in **Diagram 2** below have balls which protrude slightly from the bearing face.

Diagram 2.

their degree of protrusion is listed below

Units mm

Bearing number	Width dimension $B$	Total width dimension $B_1$
2222S (K)	53	54
2316S (K)	58	59
2319S (K)	67	68
2320S (K)	73	74
2321S	77	78
2322S (K)	80	81
1318S (K)	43	46
1319S (K)	45	49
1320S (K)	47	53
1321S	49	55
1322S (K)	50	56

## 4. Allowable misalignment angle

Listed below are the allowable misalignment angles for bearings with self-aligning characteristics when placed under normal load conditions. This degree of allowable misalignment may be limited by the design of structures around the bearing.

Allowable misalignment under normal loads (loads equivalent to  $0.09 C_r$ ):  $0.07 \text{ rad } (4^\circ)$

Cylindrical bore

Tapered bore

## 1. Types, design features, and characteristics

Since the rolling elements in cylindrical roller bearings make line contact with raceways, these bearings can accommodate heavy radial loads. The rollers are guided by ribs on either the inner or outer ring, therefore these bearings are also suitable for high speed applications. Furthermore, cylindrical roller bearings are separable, and relatively easy to install and disassemble even when interference fits are required.

Among the various types of cylindrical roller bearings, Type E has a high load capacity and its boundary dimensions are identical to standard type. HT type has a

large axial load capacity, and HL type provides extended wear life in conditions where the development of a lubricating film inside the bearing is difficult.

Double and multiple row bearing arrangements are also available.

For extremely heavy load applications, the non-separable full complement SL type bearing offers special advantages.

**Table 1** shows the various types and characteristics of single row cylindrical roller bearings. **Table 2** shows the characteristics of non-standard type cylindrical roller bearings.

**Table 1** Cylindrical roller bearing types and characteristics

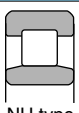

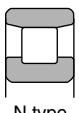

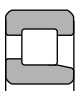

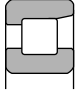

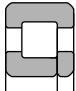

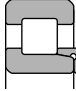

Type code	Design	Characteristics
<b>NU type</b> <b>N type</b>	 NU type  N type	<ul style="list-style-type: none"> <li>• NU type outer rings have double ribs; outer ring and roller as well as cage can be separated from inner ring. N type inner ring have double ribs; inner ring and roller as well as cage can be separated from outer ring.</li> <li>• Unable to accommodate even the lightest axial loads.</li> <li>• This type is extremely suitable for, and widely used as, the floating side bearing.</li> </ul>
<b>NJ type</b> <b>NF type</b>	 NJ type  NF type	<ul style="list-style-type: none"> <li>• NJ type has double ribs on outer ring, single rib on inner ring; NF type has single rib on outer ring, and double rib on inner ring.</li> <li>• Can receive single direction axial loads.</li> <li>• When there is no distinction between the fixed side and floating side bearing, can be used as a pair in close proximity.</li> </ul>
<b>NUP type</b> <b>NH type</b> <b>(NJ + HJ)</b>	 NUP type  NH type	<ul style="list-style-type: none"> <li>• NUP type has a collar ring attached to the ribless side of the inner ring; NH type is NJ type with an L type collar ring attached. All of these collar rings are separable, and therefore it is necessary to fix the inner ring axially.</li> <li>• Can accommodate axial loads in either direction.</li> <li>• Widely used as the shaft's fixed-side bearing.</li> </ul>

Table 2 Non-standard type cylindrical roller bearing characteristics

Bearing type	Characteristics
<p><b>E Type cylindrical roller bearing</b></p> <p>E type    Standard type</p> <p>                     NU2220E <math>C_r=335kN</math> E type bearing                      NU320 <math>C_r=299kN</math> Standard type bearing                      NU224E <math>C_r=335kN</math> E type bearing                 </p> <p>Remarks: In the dimension tables, both E type and standard type are listed, but in the future JIS will change to E type.</p>	<ul style="list-style-type: none"> <li>Boundary dimensions are the same as the standard type, but the diameter, length and number of the rollers have been increased, as well as load capacity.</li> <li>Identified by addition of "E" to end of basic roller number.</li> <li>Enables compact design due to its high load rating.</li> <li>Rollers' inscribed circle diameter differs from standard type rollers and therefore cannot be interchanged.</li> </ul>
<p><b>Large axial load use cylindrical roller bearings (HT type)</b></p>	<ul style="list-style-type: none"> <li>Can accommodate larger axial loads than standard type thanks to improved geometry of the rib roller end surface.</li> <li>Please consult NTN Engineering concerning the many factors which require consideration, such as load, lubricant, and installation conditions.</li> </ul>
<p><b>Double row cylindrical roller bearings</b></p>	<ul style="list-style-type: none"> <li>NN type and NNU type available.</li> <li>Widely used for applications requiring thin-walled bearings, such the main shafts of machine tools, rolling machine rollers, and in printing equipment.</li> <li>Internal radial clearance is adjusted for the spindle of machine tools by pressing the tapered bore of the inner ring on a tapered shaft.</li> </ul>
<p><b>Four row cylindrical roller bearings</b></p>	<ul style="list-style-type: none"> <li>Used mainly in the necks of rolling machine rollers; designed for maximum rated load to accommodate the severely limited space in the roller neck section of such equipment.</li> <li>Many varieties exist, including sealed types, which have been specially designed for high speed use, to prevent creeping, provide dust and water proofing properties, etc. Contact NTN Engineering.</li> </ul>
<p><b>SL type cylindrical roller bearings</b></p>	<ul style="list-style-type: none"> <li>Full complement roller bearing capable of handling heavy loads.</li> <li>Consult NTN Engineering regarding special application designs for SL type cylindrical roller bearings.</li> </ul>

## 2. Standard cage types

Table 3 shows the standard varieties for cylindrical roller bearings.

Table 3 Standard cage types

Bearing series	Molded resin cage	Pressed cage	Machined cage
NU10	—	—	1005~10/500
NU 2 NU2E	— 204E~218E	208~230 —	232~264 219E~240E
NU22 NU22E	— 2204E~2218E	2208~2230 —	2232~2264 2219E~2240E
NU3 NU3E	— 304E~314E	308~324 —	326~356 315E~332E
NU23 NU23E	— 2304E~2311E	2308~2320 —	2322~2356 2312E~2332E
NU4	—	405~416	—

The basic load ratings listed in the dimension charts correspond to values achieved with the standard cages listed in Table 3. Furthermore, please note that even for the identical bearing, in cases where the number of rolling elements or the cage type differs, the basic rated load will also differ from the values listed in the dimension charts.

- Note: 1) Within the same bearing series, cage type is identical even if the type code (NJ, NUP, N, NF) differs.
- 2) For high speed and other special applications, machined cages can be manufactured when necessary. Consult NTN Engineering.
- 3) Among E type bearings (those using molded resin cages), certain varieties may also use pressed cages. Consult NTN Engineering.
- 4) Although machined cages are standard for two row and four row cylindrical roller bearings, molded resin cages may also be used in some of these bearings for machine tool applications.
- 5) **Due to their material properties, molded resin cages cannot be used in applications where temperatures exceed 120°C. #04 - #07 however use resin material with superior ability to withstand heat and high temperatures, which are capable of withstanding temperatures up to 150°C.**
- 6) Formed resin cages capable of withstanding temperatures up to 150°C can be manufactured by request for type E (formed resin cage) of #08 or greater. For information, please contact NTN Engineering.

### 3. Allowable misalignment

Although values vary somewhat depending on bearing type and internal specifications, under general load conditions, to avoid the occurrence of edge loading, allowable misalignments have been set as follows:

Bearing width series 0 or 1: .....	0.001 rad (3.5')
Bearing width series 2: .....	0.0005 rad (1.5')
Double row cylindrical roller bearings ①: .....	0.0005 rad (1.5')

① Does not include high precision bearings for machine tool main shaft applications.

### 4. Allowable axial load for cylindrical roller bearings

Cylindrical roller bearings with ribs on the inner and outer rings are capable of simultaneously bearing a radial load and an axial load of a certain degree. Unlike basic load ratings based on rolling fatigue, allowable axial load is determined by heat produced on the sliding surface between the ends of the rollers and rib, seizure and wear. Allowable axial load when center axial load is applied is approximately determined by formula (1), which is based upon experience and testing.

$$P_t = k \cdot d^2 \cdot P_z \dots\dots\dots(1)$$

Where:

- $P_t$  : Allowable axial load when rotating N {kgf}
- $k$  : Factor determined by internal design of bearing (see **Table 4**)
- $d$  : Bearing bore mm
- $P_z$  : Allowable surface pressure of rib MPa {kgf/mm<sup>2</sup>} (see **Diagram 1**)

If axial load is greater than radial load, the rollers will not rotate properly. The allowable axial load therefore must not exceed the value for  $F_{a \max}$  given in **Table 4**.

The following are also important to operate the bearing smoothly under axial load:

- (1) Do not make the internal radial clearance any larger than necessary.
- (2) Use lubricant with extreme pressure additive.
- (3) Make the shoulder of the housing and shaft high enough for the rib of the bearing.
- (4) If the bearing is to support an extreme axial load, mounting precision should be improved and the bearing should rotate slowly before actual use.

If large cylindrical roller bearings (bore of 300 mm or more)

are to support an axial load or moment load simultaneously, please contact NTN Engineering.

NTN Engineering also offers cylindrical roller bearings for high axial loads (HT type). For details, please contact NTN Engineering.

1) This value achieved with machined cages; when pressed cages are used, 80% of this value is acceptable.  
 2) Production switched to E type only for bearing number for which there is no standard form.  
 3) Minimal allowable dimension for chamfer dimension  $r$  or  $r_1$ .

**Dynamic equivalent radial load**

$$P_r = F_r$$

**Static equivalent radial load**

$$P_{or} = F_r$$

1) This value achieved with machined cages; when pressed cages are used, 80% of this value is acceptable.

2) Production switched to E type only for bearing number for which there is no standard form.

3) Minimal allowable dimension for chamfer dimension  $r$  or  $r_1$ .

**Dynamic equivalent radial load**

$$P_r = F_r$$

**Static equivalent radial load**

$$P_{Or} = F_r$$

1) Minimal allowable dimension for chamfer dimension  $r$ . Note: 1. This L type collar ring is used with **NU** type cylindrical roller bearings; in duplex arrangements with **NJ** or **NU** type bearing numbers, they become **NH** type and **NUJ** type respectively. For bearing dimensions, allowable rotations, and mass, please refer to pages **B-80** to **B-84**. 2. " \* " indicates L type collar rings that can also be used with dimension series **22** bearings.

1) Minimal allowable dimension for chamfer dimension r. Note: 1. This L type collar ring is used with **NU** type cylindrical roller bearings; in duplex arrangements with **NJ** or **NU** type bearing numbers, they become **NH** type and **NUJ** type respectively. For bearing dimensions, allowable rotations, and mass, please refer to pages **B-84** to **B-88**. 2. " \* " indicates L type collar rings that can also be used with dimension series **22** bearings.

Note: **Drawing 2** represents a bearing with hollow rollers and pin type cage.

Single row tapered roller bearings

Double row tapered roller bearings

Four row tapered roller bearings

## 1. Types, design features, and characteristics

Tapered roller bearings are designed so the tapered vertex of the raceway surfaces of the inner and outer rings and rollers converge at one point on the centerline of the bearing.

Due to this design feature, rollers move along the center of the raceway surfaces. The tapered rollers are guided by the compound force of the inner and outer raceway surfaces which keep them pressed up against the large rib on the inner ring. A large variety of these bearings, including single, double, and four row arrangements, are in use both in metric and inch series.

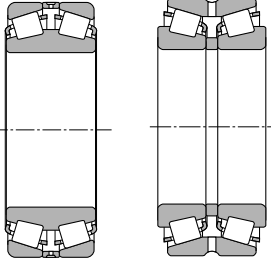

Diagram 1.

Table 1 Tapered roller bearing types and characteristics

Type	Characteristics									
Single row tapered roller bearings	<p>(1) There are both metric and inch series, and they have been standardized as shown in the following table.</p> <p><b>Dimension series</b></p> <table border="1"> <thead> <tr> <th></th> <th>Metric series</th> <th>Inch series</th> </tr> </thead> <tbody> <tr> <td>Regulations</td> <td> <ul style="list-style-type: none"> <li>• JIS B 1512</li> <li>• ISO 355</li> </ul> </td> <td> <ul style="list-style-type: none"> <li>• ABMA (includes metric J-series)</li> </ul> </td> </tr> <tr> <td>Basic number</td> <td>                     Example, 30210                      * T2EE040                 </td> <td>                     Inner ring no. / outer ring no.                      ("J" appears at the beginning of the basic number in the case of J-series.)                 </td> </tr> </tbody> </table> <p>* Dimension series previously not covered by 3XX are regulated under JIS B 1512; dimensions previously missing from 3XX will henceforth use the bearing number.</p> <p>(2) In addition to level type, there are also medium contact angle and large contact angle types, and the contact angle code C and D, respectively, is appended to the basic numbers of the latter two types.</p> <p>(3) Subunits                      Tapered roller bearings can be disassembled into parts — the inner ring, rollers, and cage (collectively known as the "cone") — and the outer ring (known as the "cup"). These are the bearing's "subunits". Subunit dimensions are standardized under ISO or ABMA standards, and unified subunits are interchangeable within each dimensional standard. However, high precision grade bearings are generally not interchangeable, and these subunits must be used by assembling only subunits with identical manufacturing numbers.                      Aside from any cautionary notes that may appear, the single row tapered roller bearings listed in the dimension tables have subunits standardized for both metric and inch systems (including J series). Table 1 (continued)

Type	Characteristics
<p><b>Single row tapered roller bearings</b></p>	<p>(4) These bearings are constructed to have a high capacity for radial loads, axial loads, and combined loads. The larger the contact angle, the greater the axial load capacity becomes. When a pure radial load is placed on the bearings, an induced load in the axial direction is also generated, and so these bearings are generally used in pairs arranged face to face.</p> <p>(5) When used in pairs, proper internal clearances and preload can be set by adjusting the distance between the two bearings' inner and outer rings.</p> <p>(6) Single row tapered roller bearings are separable, so both the inner and outer rings can be used with tight fits.</p> <p>(7) Tapered roller bearings are also manufactured with flanges attached to the outer rings. For more details, contact NTN Engineering. (Refer to <b>Diagram 3</b>)</p> <div data-bbox="1161 443 1485 779" style="text-align: center;">  <p><b>Diagram 3.</b></p> </div>
<p><b>Double row tapered roller bearings</b></p>	<p>(1) Back-to-back arrangement (using double row outer rings) and face-to-face arrangement (using double row inner rings) are both available, and they have been adjusted so that each type's internal clearance values are fixed. Therefore, only parts with identical manufacturing numbers can be used and they must be assembled according to their code numbers. (Refer to <b>Diagram 4</b>)</p> <p>(2) The axial internal clearances for double and duplex bearings are listed in <b>Table 8, 9</b> on pages A-58.</p> <p>(3) Pairs of duplex single row tapered roller bearings are also manufactured. For more details, contact NTN Engineering.</p> <div data-bbox="1161 853 1485 1189" style="text-align: center;">  <p>Face-to-face      Back-to-back</p> <p><b>Diagram 4.</b></p> </div>
<p><b>Four row tapered roller bearings</b></p>	<p>(1) As shown in <b>Diagram 5</b>, four row tapered roller bearings are constructed of two double row inner rings and two double row outer rings.</p> <p>(2) Life of large bearings is extended by using case hardened steel, hollow rollers and pin-type cages.</p> <p>(3) Used primarily where heavy load capacity is important, and in the roller necks of rolling mills.</p> <div data-bbox="1161 1234 1485 1503" style="text-align: center;">  <p><b>Diagram 5.</b></p> </div>

## 2. Standard cage type

In general, pressed cages are used in tapered roller bearings.

However, for large sized bearings, machined or pin type cages are also used; and for small sized bearings, molded resin cages are also used.

## 3. Allowable misalignment

<p>Single row and back-to-back arrangement: .....0.0005rad (1.5')</p> <p>Face-to-face arrangement: .....0.001rad (3.5')</p>
---

In situations where large displacement is necessary, please consult NTN Engineering.

## 4. Precautions when using

If bearing load is light during operation, or if the ratio of axial to radial load for duplex and double row bearings exceeds the value of  $e$ , slipping develops between the rollers and raceway, sometimes resulting in smearing. The mass of rollers and cages particularly tends to be large for large tapered roller bearings. For details, please contact NTN Engineering.

## 5. ECO-Top tapered roller bearings

In recent years, there has been an increasing demand for small and medium tapered roller bearings that contribute to energy savings, higher output, longer life, higher speed and more efficient assembly, particularly for automobiles. NTN Engineering is responding to this demand by providing bearings with special specifications based on 4Top tapered roller bearings, which are standard bearings.

In order to contribute to the ecology movement, in addition to enhancing existing special specifications, NTN Engineering has developed the next-generation NTN Engineering tapered roller bearing **ECO-Top tapered roller bearing** having improved long life, low torque, anti-seizure, easy assembly specifications. The features are as follows (compared with NTN Engineering standard bearings):

- (1) Ten times longer life using contaminated lubricant
- (2) Two times longer life using clean lubricant
- (3) At least 10% lower torque in practical rotation range
- (4) 25% better anti-seizure performance
- (5) Two times better loss-of-preload resistance
- (6) Half reduced number of revolutions to stable assembled bearing width

For details, please contact NTN Engineering.

Eco-Top tapered roller bearings

1) Minimal allowable dimension for chamfer dimension r or r<sub>1</sub>.

2) This bearing does not incorporate the subunit dimensions.

### Equivalent radial load dynamic

$$P_r = X F_r + Y F_a$$

$\frac{F_a}{F_r} \leq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	0	0.4	Y <sub>2</sub>

### static

$$P_{or} = 0.5 F_r + Y_0 F_a$$

When  $P_{or} < F_r$  use  $P_{or} = F_r$

For values of  $e$ ,  $Y_2$  and  $Y_0$  see the table below.

Dimensions series to ISO	Abutment and fillet dimensions										Load center mm	Constant $e$	Axial load factors		Mass kg (approx.)
	$d_a$ min	$d_b$ max	$D_a$ max	$D_b$ min	$S_a$ min	$S_b$ min	$r_{as}$ max	$r_{1as}$ max	$Y_2$	$Y_0$

1) Minimal allowable dimension for chamfer dimension  $r$  or  $r_1$ . 2) This bearing does not incorporate the subunit dimensions.  
 Note: When selecting bearings with bearing numbers marked with " \* ", please consult NTN Engineering.

### Equivalent radial load dynamic

$$P_r = X F_r + Y F_a$$

$\frac{F_a}{F_r} \leq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	0	0.4	$Y_2$

### static

$$P_{or} = 0.5 F_r + Y_o F_a$$

When  $P_{or} < F_r$  use  $P_{or} = F_r$

For values of  $e$ ,  $Y_2$  and  $Y_o$  see the table below.

Dimensions series to ISO	Abutment and fillet dimensions									Load center mm	Constant $e$	Axial load factors		Mass kg (approx.)
	$d_a$	$d_b$	$D_a$		$D_b$	$S_a$	$S_b$	$r_{as}$	$r_{1as}$			$Y_2$	$Y_o$

1) Minimal allowable dimension for chamfer dimension  $r$  or  $r_1$ .  
 2) This bearing does not incorporate the subunit dimensions.

### Equivalent radial load

**dynamic**  
 $P_r = X F_r + Y F_a$

$\frac{F_a}{F_r} \leq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	0	0.4	$Y_2$

**static**

$P_{or} = 0.5 F_r + Y_o F_a$

When  $P_{or} < F_r$  use  $P_{or} = F_r$

For values of  $e$ ,  $Y_2$  and  $Y_o$  see the table below.

Dimensions series to ISO	Abutment and fillet dimensions										Load center mm	Constant $e$	Axial load factors		Mass kg (approx.)
	$d_a$	$d_b$	$D_a$	$D_b$	$S_a$	$S_b$	$r_{as}$	$r_{ias}$	$Y_2$	$Y_o$

1) Minimal allowable dimension for chamfer dimension  $r$  or  $r_1$ .

### Equivalent radial load dynamic

$$P_r = XF_r + YF_a$$

$\frac{F_a}{F_r} \leq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	0	0.4	$Y_2$

### static

$$P_{or} = 0.5F_r + Y_o F_a$$

When  $P_{or} < F_r$  use  $P_{or} = F_r$

For values of  $e$ ,  $Y_2$  and  $Y_o$  see the table below.

Dimensions series to ISO	Abutment and fillet dimensions										Load center mm	Constant $e$	Axial load factors		Mass kg (approx.)
	$d_a$	$d_b$	$D_a$	$D_b$	$S_a$	$S_b$	$r_{as}$	$r_{1as}$	$Y_2$	$Y_o$

1) Minimal allowable dimension for chamfer dimension  $r$  or  $r_1$ .  
 2) This bearing does not incorporate the subunit dimensions.

### Equivalent radial load dynamic

$$P_r = X F_r + Y F_a$$

$\frac{F_a}{F_r} \leq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	0	0.4	Y <sub>2</sub>

### static

$$P_{or} = 0.5 F_r + Y_0 F_a$$

When  $P_{or} < F_r$  use  $P_{or} = F_r$

For values of  $e$ ,  $Y_2$  and  $Y_0$  see the table below.

Dimensions series to ISO	Abutment and fillet dimensions									Load center mm	Constant $e$	Axial load factors		Mass kg (approx.)

21.430	50.005	17.526	18.288	13.970	38.0	39.0	3 850	3 950	8 000	11 000	
21.986	45.974	15.494	16.637	12.065	29.6	34.0	3 000	3 450	8 400	11 000	
22.225	50.005	13.495	14.260	9.525	26.0	27.9	2 650	2 850	7 500	10 000	
	50.005	17.526	18.288	13.970	38.0	39.0	3 850	3 950	8 000	11 000	
	52.388	19.368	20.168	14.288	40.5	43.0	4 150	4 350	7 600	10 000	
	53.975	19.368	20.168	14.288	40.5	43.0	4 150	4 350	7 600	10 000	

Note: 1. Chamfer dimensions on the back face of the inner and outer rings of the bearing are larger than maximum values for installation dimensions  $r_{1as}$  and  $r_{2as}$ .  
 2. As for the maximum value for inner and outer ring diameters of bearings whose bearing numbers are marked with "+" (inner ring) and "++" (outer ring), the precision class is an integer for class 4 and class 2 bearings only.

### Equivalent radial load dynamic

$$P_r = XF_r + YF_a$$

$\frac{F_a}{F_r} \leq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	0	0.4	$Y_2$

### static

$$P_{or} = 0.5F_r + Y_0F_a$$

When  $P_{or} < F_r$  use  $P_{or} = F_r$

For values of  $e$ ,  $Y_2$  and  $Y_0$  see the table below.

Bearing numbers	Abutment and fillet dimensions						Load center mm	Constant	Axial load factors		Mass kg
	mm								$a$	$e$

Note: 1. Chamfer dimensions on the back face of the inner and outer rings of the bearing are larger than maximum values for installation dimensions  $r_{as}$  and  $r_{1as}$ .  
 2. As for the maximum value for inner ring bore diameters of bearings whose bearing numbers are marked with "+" (inner ring), the precision class is an integer for class 4 and class 2 bearings only.

### Equivalent radial load dynamic

$$P_r = X F_r + Y F_a$$

$\frac{F_a}{F_r} \leq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	0	0.4	Y <sub>2</sub>

### static

$$P_{or} = 0.5 F_r + Y_0 F_a$$

When  $P_{or} < F_r$  use  $P_{or} = F_r$

For values of  $e$ ,  $Y_2$  and  $Y_0$  see the table below.

Bearing numbers	Abutment and fillet dimensions						Load center mm	Constant e	Axial load factors		Mass kg (approx.)
	$d_a$	$d_b$	$D_a$	$D_b$	$r_{as}$ max	$r_{1as}$ max			$Y_2$	$Y_0$

Note: 1. Chamfer dimensions on the back face of the inner and outer rings of the bearing are larger than maximum values for installation dimensions  $r_{is}$  and  $r_{ios}$ .  
 2. As for the maximum value for inner and outer ring diameters of bearings whose bearing numbers are marked with "+" (inner ring) and "++" (outer ring), the precision class is an integer for class 4 and class 2 bearings only.

### Equivalent radial load dynamic

$$P_r = XF_r + YF_a$$

$\frac{F_a}{F_r} \leq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	0	0.4	Y <sub>2</sub>

### static

$$P_{or} = 0.5F_r + Y_0F_a$$

When  $P_{or} < F_r$  use  $P_{or} = F_r$

For values of  $e$ ,  $Y_2$  and  $Y_0$  see the table below.

Bearing numbers	Abutment and fillet dimensions						Load center mm	Constant e	Axial load factors		Mass kg (approx.)

Note: 1. Chamfer dimensions on the back face of the inner and outer rings of the bearing are larger than maximum values for installation dimensions  $r_{as}$  and  $r_{1as}$ .

### Equivalent radial load dynamic

$$P_r = XF_r + YF_a$$

$\frac{F_a}{F_r} \leq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	0	0.4	Y <sub>2</sub>

### static

$$P_{or} = 0.5F_r + Y_0F_a$$

When  $P_{or} < F_r$  use  $P_{or} = F_r$

For values of  $e$ ,  $Y_2$  and  $Y_0$  see the table below.

Bearing numbers	Abutment and fillet dimensions						Load center mm	Constant e	Axial load factors		Mass kg (approx.)
	mm								a	Y <sub>2</sub>	
	d <sub>a</sub>	d <sub>b</sub>	D <sub>a</sub>	D <sub>b</sub>	r <sub>as</sub> max	r <sub>1as</sub> max

Note: 1. With regard to the chamfer dimensions on the back face of the inner and outer rings, installation dimensions  $r_{1is}$  and  $r_{1os}$  are larger than the maximum value.  
2. Bearing numbers marked " # " designate J-series bearings. The accuracy of these bearings is listed in Table 6.6 on page A-42.

### Equivalent radial load dynamic

$$P_r = XF_r + YF_a$$

$\frac{F_a}{F_r} \leq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	0	0.4	$Y_2$

### static

$$P_{or} = 0.5F_r + Y_0F_a$$

When  $P_{or} < F_r$  use  $P_{or} = F_r$

For values of  $e$ ,  $Y_2$  and  $Y_0$  see the table below.

Bearing numbers	Abutment and fillet dimensions						Load center mm	Constant $e$	Axial load factors		Mass kg (approx.)

Note: 1. Chamfer dimensions on the back face of the inner and outer rings of the bearing are larger than maximum values for installation dimensions  $r_{1as}$  and  $r_{1is}$ .  
 2. As for the maximum value for inner ring bore diameters of bearings whose bearing numbers are marked with "+" (inner ring), the precision class is an integer for class 4 and class 2 bearings only.

### Equivalent radial load dynamic

$$P_r = XF_r + YF_a$$

$\frac{F_a}{F_r} \leq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	0	0.4	$Y_2$

### static

$$P_{or} = 0.5F_r + Y_0F_a$$

When  $P_{or} < F_r$  use  $P_{or} = F_r$

For values of  $e$ ,  $Y_2$  and  $Y_0$  see the table below.

Bearing numbers	Abutment and fillet dimensions						Load center mm	Constant $e$	Axial load factors		Mass kg (approx.)

Note: 1. Chamfer dimensions on the back face of the inner and outer rings of the bearing are larger than maximum values for installation dimensions  $r_{as}$  and  $r_{1as}$ .  
2. Bearing numbers marked " # " designate J-series bearings. The accuracy of these bearings is listed in Table 6.6 on page A-42.

### Equivalent radial load dynamic

$$P_r = XF_r + YF_a$$

$\frac{F_a}{F_r} \leq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	0	0.4	$Y_2$

### static

$$P_{or} = 0.5F_r + Y_0F_a$$

When  $P_{or} < F_r$  use  $P_{or} = F_r$

For values of  $e$ ,  $Y_2$  and  $Y_0$  see the table below.

Bearing numbers	Abutment and fillet dimensions						Load center mm	Constant $e$	Axial load factors		Mass kg (approx.)
	mm								$a$	$e$	
	$d_a$	$d_b$	$D_a$	$D_b$	$r_{as}$ max	$r_{1as}$ max

Note: 1. Chamfer dimensions on the back face of the inner and outer rings of the bearing are larger than maximum values for installation dimensions  $r_{as}$  and  $r_{1as}$ .  
2. Bearing numbers marked " # " designate J-series bearings. The accuracy of these bearings is listed in Table 6.6 on page A-42.

### Equivalent radial load dynamic

$$P_r = XF_r + YF_a$$

$\frac{F_a}{F_r} \leq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	0	0.4	$Y_2$

### static

$$P_{or} = 0.5F_r + Y_0F_a$$

When  $P_{or} < F_r$  use  $P_{or} = F_r$

For values of  $e$ ,  $Y_2$  and  $Y_0$  see the table below.

Bearing numbers	Abutment and fillet dimensions						Load center mm	Constant e	Axial load factors		Mass kg (approx.)
	mm								$a$	$e$	
	$d_a$	$d_b$	$D_a$	$D_b$	$r_{as}$ max	$r_{1as}$ max

Note: 1. Chamfer dimensions on the back face of the inner and outer rings of the bearing are larger than maximum values for installation dimensions  $r_{as}$  and  $r_{1as}$ .  
2. Bearing numbers marked " # " designate J-series bearings. The tolerances of these bearings is listed in Table 6.6 on page A-42.

### Equivalent radial load dynamic

$$P_r = XF_r + YF_a$$

$\frac{F_a}{F_r} \leq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	0	0.4	$Y_2$

### static

$$P_{or} = 0.5F_r + Y_o F_a$$

When  $P_{or} < F_r$  use  $P_{or} = F_r$

For values of  $e$ ,  $Y_2$  and  $Y_o$  see the table below.

Bearing numbers	Abutment and fillet dimensions						Load center mm	Constant mm	Axial load factors		Mass kg (approx.)

1) Minimum allowable dimension for chamfer dimension  $r$  or  $r_1$ .

Note: 1. When incorporating bearings with bearing numbers marked with " \* ", please consult NTN Engineering.

### Equivalent radial load

$$P_r = XF_r + YF_a$$

$\frac{F_a}{F_r} \leq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	Y <sub>1</sub>	0.67	Y <sub>2</sub>

### static

$$P_{or} = F_r + Y_0 F_a$$

For values of  $e$ ,  $Y_2$  and  $Y_0$  see the table below.

Bearing numbers	Abutment and fillet dimensions					Load center mm <i>a</i>	Constant <i>e</i>	Axial load factors			Mass kg (approx.)
	<i>d<sub>a</sub></i> min	<i>D<sub>b</sub></i> min	<i>S<sub>b</sub></i> min	<i>r<sub>as</sub></i> max	<i>r<sub>1as</sub></i> max			<i>Y<sub>1</sub></i>	<i>Y<sub>2</sub></i>	<i>Y<sub>0</sub></i>

Note: 1. Bearing numbers marked " \* " designate inch series bearings.  
 2. Bearing numbers marked " ☆ " designate bearing with hollow rollers and pin type cages.

## 1. Types, construction and characteristics

Spherical roller bearings consist of an outer ring having a continuous spherical raceway within which operates two rows of barrel-shaped rollers which are in turn guided by an inner ring with two raceways separated by a center rib. (Refer to **Diagram 1**) This bearing has self-aligning properties, and therefore is suited for use where misalignment between the inner and outer rings occurs from housing installation error or shaft flexure.

Spherical roller bearings have a large capacity for radial loads, axial loads in either direction, and complex loads. They are also suited for applications where vibration and shock loads are encountered. When operating under axial loads, however, it is desirable to maintain conditions so that  $F_a/F_r \leq 2e$  in order to prevent sliding movement along the row of rollers not receiving the axial load. (For the value of  $e$ , refer to dimension tables.)

As shown in **Table 1**, in addition to standard type there are various other types of spherical roller bearings. Among these, **Type E** has a particularly high load capacity.

In addition to bearings with cylindrical bore, those with tapered bore are also available. Bearings with tapered bore are specified by attaching the suffix "K" to the end of the bearing's basic number. The standard taper ratio is 1:12 for bearings with a "K" suffix, but for bearings in series 240 and 241 the suffix "K30" indicates the taper ratio for a bearing is 1:30. Most tapered bore bearings incorporate the use of adapters and withdrawal sleeves for shaft mounting.

Diagram 1.

Table 1 Types of spherical roller bearings

Type	Standard type (B type)	C type	213 type	E type
<b>Construction</b>				
<b>Bearing series</b>	Does not include C type	Series 222, 223, and 213 with bore dia. of 50 mm or less; series 24024 to 24038.	Series 213 with bore dia. of 55 mm or more	Series 22211 to 22218
<b>Rollers</b>	Asymmetrical	Symmetrical	Asymmetrical	Symmetrical
<b>Roller guide method</b>	Unified inner ring center rib	By guide ring between the 2 rows of rollers	By guide ring between rows of rollers on outer ring raceway	High precision cage (no guide ring, center rib)
<b>cage type</b>	Pressed cage; machined cage	Pressed cage	Machined cage	Molded resin cage

## 2. Standard cage types

Standard cage types for spherical roller bearings are shown in **Table 2**. In general, pressed cages are standard for small sized bearings, and machined cages are standard for large sized bearings.

E type bearings use as their standard cage type a cage molded from a newly developed glass fiber reinforced **polyamide 46 resin which has excellent heat resistance qualities (allowable operating temperatures up to 150°C)**, strength, as well as unsurpassed oil resistance.

A standard cage may however not be able to be used for high-speed specifications, in high temperature atmospheres, or under excessive vibration/impact conditions. For more information concerning such conditions, please contact NTN Engineering.

**Table 2 Standard cage types**

Bearing series	Molded resin cage	Pressed cage	Machined cage
239	—	—	23932 ~ 239/1400
230	—	23022B ~ 23048B	23052B ~ 230/1120B
240	—	24024C ~ 24038C	24024B ~ 240/1120B
231	—	23120B ~ 23136B	23138B ~ 231/900B
241	—	—	24122B ~ 241/710B
222	22211E ~ 22218E	22208C ~ 22210C 22211B ~ 22236B	22238B ~ 22264B
232	—	—	23218B ~ 232/750B
213	—	21308C ~ 21310C	21311 ~ 21322
223	—	22308C ~ 22310C 22311B ~ 22328B	22330B ~ 22360B

**Table 3 Oil inlet and oil groove dimensions** Units mm

Nominal bearing width		Oil groove width $W_o$	Oil inlet diameter $d_o$	Oil groove depth $h$

100	120	16	10	3.0	2.5
120	160	20	12	3.5	3.0
160	200	27	16	5.0	3.5
200	315	33	20	6.0	5.0
315	—	42	25	7.0	6.5

**Table 4 Oil inlet number**

Nominal bearing outer diameter mm	Oil inlet number	
over up to	including	
—	320	4
320	1 010	8
1 010	—	12

If a pin is necessary to prevent outer ring rotation, contact NTN Engineering.

## 3. Oil inlets and oil groove dimensions

Spherical roller bearings with an outer diameter of 320mm or more are provided with an oil inlet and oil groove on the outer ring for the purpose of supplying lubricant to the bearing's moving parts. When necessary, oil inlets and oil grooves can also be provided on bearings with outer diameters less than 320 mm. In such cases, please add the supplementary suffix code "D1" to the end of the bearing number, and contact NTN Engineering. (Refer to page A-29)

**Table 3** lists dimensions for oil inlets and oil grooves. **Table 4** contains information about the number of oil inlets.

## 4. Allowable misalignment

Spherical roller bearings possess the same self-aligning properties as other self-aligning bearings. The allowable misalignment angle will vary according to dimension series and load conditions, but the following misalignment angles are generally standard:

Normal load (loads equivalent to 0.09 $C_r$ ):	0.009rad (0.5°)
Light load:	0.035rad (2°)

## 5. Adapters and withdrawal sleeves

Adapters are used for installation of bearings with tapered bore on cylindrical shafts. Withdrawal sleeves are also used to install and disassemble bearings with tapered bore onto and off of cylindrical shafts. In disassembling the bearing from the shaft, the nut is pressed down against the edge of the inner ring utilizing the bolt provided on the withdrawal sleeve, and then the sleeve is drawn away from the bearing's inner diameter surface. (Precision of adapter and withdrawal sleeve are stipulated JIS B 1552 and JIS B 1556).

For bearings with a bore diameter of 200 mm or more, high pressure oil (hydraulic) type adapters and withdrawal sleeves have been standardized to make installation and disassembly easier. As shown in **Diagram 2** construction is designed to reduce friction by injecting high pressure oil between the surfaces of the adapter sleeve and bearing inner bore by means of a pressure fitting.

If the oil supply inlet is attached in the nut side of the adapter, the supplementary suffix "HF" should be added to the bearing number; if the oil supply inlet is attached on the opposite side, the suffix "HB" should be added to the bearing number. For adapter sleeves, the supplementary suffix "H" is added to the bearing's number in both cases.

The hydraulic sleeve nut is equipped with holes for bolts used for mounting and dismounting and holes for hydraulic piping. The suffix SP or SPB is added to the bearing number of the nut.

Diagram 2.

## 6. LH series

In recent years, conditions under which spherical roller bearings are used have become increasingly severe. In particular, longer life is now demanded for use in high temperature environments.

Taking the global environment into account, NTN Engineering has developed a type of steel (STJ2) that offers longer life in a wide range of temperatures, from room temperature all the way up to 250°C. The steel is standardly used in NTN Engineering's **LH series of spherical roller bearings**.

Features are as follows (in comparison with SUJ2):

**(1) Longer life in wide range of temperatures.**

- 3.5 times longer life at room temperature.
- 30 times longer life at high temperature (250°C).

**(2) Resists surface damage.**

- 7 times stronger resistance to peeling
- 1.4 times stronger resistance to smearing
- 2.5 times stronger resistance to wear

**(3) Dimensions stability at high temperatures.**

- Almost no dimensional variation when maintained at 250°C.

**(4) Enhanced cracking fatigue strength.**

- 2 times longer cracking fatigue life under high temperatures or tight fitting stress.
- 2 times better operating cracking fatigue strength.

**(5) Simplified service part stock management.**

- Applications ranging from room temperature to 250°C can be handles with a single type of standard bearing.

Items with LH preceding the basic number in the dimensions table are LH series and are gradually being switched.

Bearing numbers without LH can be manufactured according to size. For information, please contact NTN Engineering.

1) This value was achieved with machined cages and molded resin cages; for pressed cages, 75% of this value is allowable.

2) Bearings appended with "K" have a tapered bore ratio of 1:12. 3) Smallest allowable dimension for chamfer dimension *r*.

4) Bearing number with the prefix LH indicates LH series.

### Equivalent radial load dynamic

$$P_r = X F_r + Y F_a$$

$\frac{F_a}{F_r} \leq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	$Y_1$	0.67	$Y_2$

### static

$$P_{or} = F_r + Y_0 F_a$$

For values of  $e$ ,  $Y_2$  and  $Y_0$   
see the table below.

Abutment and fillet dimensions					Constant	Axial load factors			Mass (approx.)

Note: An oil groove is provided for outer rings of bearings with an outer diameter ( $D$  dimension) of 320 mm or more. See page B-212 on dimensions. We can make bearings with oil hole or oil groove in the outer ring, per your request, for an outer diameter of 320mm or less. Such bearings are indicated by attaching "D1" to the end of the bearing number. (ex. 23032BD1)

1) This value was achieved with machined cages and molded resin cages; for pressed cages, 75% of this value is allowable.

2) Bearings appended with "K" have a tapered bore ratio of 1:12. 3) Smallest allowable dimension for chamfer dimension r.

### Equivalent radial load

$$P_r = XF_r + YF_a$$

$\frac{F_a}{F_r} \leq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	$Y_1$	0.67	$Y_2$

### static

$$P_{or} = F_r + Y_0 F_a$$

For values of  $e$ ,  $Y_2$  and  $Y$  see the table below.

Abutment and fillet dimensions			Constant	Axial load factors			Mass (approx.)

Note: An oil groove is provided for outer rings of bearings with an outer diameter ( $D$  dimension) of 320 mm or more. See page B-220 on dimensions. We can make bearings with oil hole or oil groove in the outer ring, per your request, for an outer diameter of 320mm or less. Such bearings are indicated by attaching "D1" to the end of the bearing number. (ex. 23032BD1)

1) "K" indicates bearings have tapered bore with a taper ratio of 1: 12.  
 2) Smallest allowable dimension for chamfer dimension *r*.

### Equivalent radial load

**dynamic**

$$P_r = XF_r + YF_a$$

$\frac{F_a}{F_r} \leq e$		$\frac{F_a}{F_r} > e$	
X	Y	X	Y
1	$Y_1$	0.67	$Y_2$

**static**

$$P_{or} = F_r + Y_0 F_a$$

For values of  $e$ ,  $Y_2$  and  $Y_0$  see the table below.

Abutment and fillet dimensions			Constant	Axial load factors			Mass (approx.)	
$d_a$	$D_a$	$r_{as}$		$e$	$Y_1$	$Y_2$	$Y_0$	cylindrical bore

1) Standard thread shapes and dimensions are as per JIS B0207 (metric thread).

2) Indicates reference dimensions before attachment of withdrawal sleeve.

3) Indicates withdrawal sleeve mass.

4) Indicates number of nut to be used at time of disassembly. See pages C-2 to C-10 for nut dimensions.

Note: 1. Please refer to page B-234, B-237 for bearing dimensions, rated loads, and mass.

2. Withdrawal sleeve numbers appended with the suffix "H" signify high pressure oil (hydraulic) design. (See page B-213)

Single direction thrust ball bearings

Spherical roller thrust bearings

These bearings are designed primarily to support axial loads at contact angles between 30° and 90°. Just as with radial bearings, these bearings differ according to the type of rolling element they use: there are thrust ball bearings that use balls and thrust roller bearings that use rollers.

The configuration and characteristics of each type of bearing are given.

With thrust bearings, it is necessary to supply an axial preload in order to prevent slipping movement between the bearing's rolling elements and raceways. For more detailed information on this point, please refer to the material concerning bearing preload on page A-62.

## 1. Single direction thrust ball bearings

As shown in **Diagram 1**, the steel balls of single direction thrust ball bearings are arranged between a pair of shaft housing washers (bearing shaft washer and housing shaft washer), and the normal contact angle is 90°. Axial loads can

Table 1 Standard cage types for single direction thrust ball bearings

Bearing series	511	512	513	514
Molded resin cage	51100 ~51107	51200 ~51207	—	—
Pressed cage	51108 ~51152	51208 ~51224	51305 ~51320	51405 ~51415
Machined cage	51156 ~511/530	51226 ~51260	51322 ~51340	51416 ~51420

Note: Due to their material properties, molded resin cages can not be used in applications where temperatures exceed 120°C.

Diagram 1. Single direction thrust ball bearing (with pressed cage)

be supported in only one direction, radial loads can not be accommodated, therefore these bearings are unsuitable for high speed operation.

**Table 1** lists the standard cage types for single direction thrust ball bearings.

## 2. Spherical roller thrust bearings

Just like spherical roller bearings, the center of the spherical surface for spherical roller thrust bearings is the point where the raceway surface of the housing raceway washer meets the center axis of the bearing. Since spherical roller thrust bearings incorporate barrel-shaped rollers as rolling elements, they also have self-aligning properties. (See **Diagram 2**)

Under normal load conditions, the allowable misalignment is 1° to 2°, although this will vary depending upon the bearing's dimension series.

These bearings use machined copper alloy cages and a guide sleeve is attached to the inner ring to guide the cage. The axial load capacity of these bearings is high, and a certain amount of radial load can also be accommodated when the ring is in an axially loaded state. However, it is necessary to operate these bearings where the load condition meet  $F_r/F_a \leq 0.55$ .

**These bearings have some spots where lubricant cannot enter such as the gap between the cage and guide sleeve. It is necessary to use oil lubrication even in low speed operation.**

Diagram 2. Spherical roller thrust bearings

### 3. Cylindrical roller thrust bearings

Thrust bearings incorporating cylindrical rollers are available in single row, double row, triple row, and four row varieties. (See **Diagram 3**) NTN Engineering offers the 811, 812 and 893 series of standard series bearings that conform to dimension series 11, 12 and 93 prescribed in JIS, as well as other special dimensions.

Cylindrical roller thrust bearings are able to receive axial loads only, and have high axial rigidity which makes them well suited for heavy axial loads. Needle roller bearing information for series 811, 812, and 893 is also listed in the dimension tables.

Furthermore, bearings with dimensions not listed in the dimension tables are also manufactured. Contact **NTN Engineering** for more information.

**Diagram 3. Double row cylindrical roller thrust bearings**

### 4. Tapered roller thrust bearings

Although not listed in the dimension tables, tapered roller bearings like those in **Diagram 4** are also manufactured. Contact **NTN Engineering** for more detailed information.

1) Smallest allowable dimension for chamfer dimension r. 2) Maximum allowable dimension for shaft washer outer dimension  $d_1$ . 3) Smallest allowable dimension for housing washer inner dimension  $D_1$ . Note: Bearing numbers marked " \* " signify bearings where the bearing shaft washer outer diameter is smaller than the housing shaft washer outer diameter. Therefore when using these bearings, it is possible to use the housing bore as is, without providing a ground undercut on the outer diameter section of the bearing shaft washer as shown in the drawing.

1) Smallest allowable dimension for chamfer dimension r. 2) Maximum allowable dimension for shaft washer outer dimension d<sub>1s</sub>. 3) Smallest allowable dimension for housing washer inner dimension D<sub>1s</sub>. Note: Bearing numbers marked "\*" signify bearings where the bearing shaft washer outer diameter is smaller than the housing shaft washer outer diameter. Therefore when using these bearings, it is possible to use the housing bore as is, without providing a ground undercut on the outer diameter section of the bearing shaft washer as shown in the drawing.

1) Standard thread shapes and dimensions are as per JIS B0207 (metric thread).

2) Uses adapter series H31, H2, and H23

3) Can also use washers with straight inner tabs (code "X").

### Allowable washer dimensions Units mm

Nominal bore dia. $d_s$ mm Over up to/incl	Dimensional tolerance for distance from inner tab to bore surface $\Delta M$		Dimension tolerance for width of inner tab $\Delta J_1$	
	High	Low	High	Low
6 50	+0.3	0	+0.2	-0.2
50 80	+0.3	0	+0.5	-0.5
80 120	+0.5	0	+0.7	-0.7
120 200	+0.5	0	+1	-1

Above table is applicable to AWL series.

Note: Narrow slit type adapter sleeves appended with the **H2**, **H3**, and **H23** series code suffix "X", use straight inner tab washers (marked with "X"); wide slit type adapter sleeves without the suffix "X" can either straight or bent inner tab washers.

1kgf=9.80665N  
1N=0.101972kgf

(How to read the table) If for example you want to convert 10 kgf to N, find "10" in the middle column of the first set of columns on the right. Look in the N column directly to the right of "10," and you will see that 10 kgf equals 98.066 N. Oppositely, to convert 10 N to kgf, look in the kgf column to the right of "10" and you will see that 10 N equals 1.0197 kgf.
