Sleew Drive
Product Catalog

Strong Partnership

Strong Partnership

The strong partnership IMO has with Brück GmbH in Saarbrücken for seamless rolled rings and Brück AM in Zamsrk, Czech Rep., for CNC pre-machining, enables IMO to present a line of high performance, high quality Slewing Rings and Slew Drives.

Brück is running five rolling mills with a monthly capacity up to 3,500 tons (7,700,000 lbs)!

A strong partnership is created by Brück owners holding a 50 percent stake in IMO's equity. For you as our customer, this enables IMO to be a fast, flexible and reliable Slewing Ring and Slew Drive manufacturer.

Preface & Imprint

IMO has developed, manufactured and sold innovative Slew Drives to global customers for many years.

Our range of products is presented in this catalog.

Our wide range of standard size Slew Drives is unique on the market.

Special designs are also available, please contact our Engineering Department for assistance (the contact details are on the back of the catalog).

This catalog has a reference number on the front cover. Please always check this is the latest edition before using the information contained within it.

You will find the "Application Data Sheet" on page 108/109 in this catalog. If you require assistance with any Slew Drive application, please fill in this form. This gives us an overview of the application and represents a record of your requirements.

Slew Drives are high-tech products. They have to meet your requirements exactly and perform in the environmental conditions of your application. Therefore, it is important to fill in the form completely, with as much detail as possible and send it to us. You will then receive our recommendation for the right IMO product for your application and gain the benefit of years of experience meeting challenging customer requirements and operating conditions!

The application data sheet can also be downloaded from our homepage www.goimo.com.

You can find information on our Slewing Ring product line in the Slewing Ring catalog DV 105 E, which we will send you on request. Further details of our company, products, and their application and utilization can be found in our detailed brochure IM 104 E.

IMO terms and conditions shall apply to all quotations and purchase orders.

Further we would like to ask you to follow closely our Installation and Maintenance Instructions which contain important data. You can find these on pages 46 to 51 of this catalog, or on our homepage which has the latest revision.

The observance of our Installation and Maintenance Instructions is important for the reliability and safety of our product and has a great influence on the service-life.

The Installation and Maintenance Instructions are also available in other languages. Please contact us or visit our homepage if you need the instructions in a different language.

Our product range and designs are being continually updated and revised. Please always check with us for the latest information.

All the information in this catalog has been carefully evaluated and checked. We cannot accept responsibility for omissions and errors in this publication.

The innovative business group IMO, with headquarters in Gremsdorf, Germany, has been designing, manufacturing and supplying Slewing Rings and self-contained Slew Drives for more than 16 years. IMO currently holds EN ISO 9001:2000 approval and has been certified since 1995.

IMO, with its modern manufacturing facilities, manufactures and delivers over 10,000 Ball and Roller Slewing Rings and Slew Drives each year, in diameters up to 5,200 mm (204 in). IMO is a globally recognized supplier of Slewing Rings and patented Slew Drives.

IMO is proud to have been recently named one of Bavaria's Top 50 companies by the State Minister of Economy. IMO has also earned several technical awards at international exhibitions for new and innovative product introductions.

1) The data refers to the minimum and maximum diameter per series

2) The tilting moment capacity for each unit should be confirmed by referring to the limiting load diagram for each individual model.

Slew Drive – what is it? What does it do? Where is it used?

A complete system, ready to install, consists of

- A Ball or Roller Slewing Ring to handle simultaneously occurring radial, axial and moment loads
- Hydraulic or electric motor to pitch or rotate the Slewing Ring
- A totally enclosed housing

Bolt, connect, run... done!

Advantages of IMO Slew Drives

- Compact packages for space saving installations
- Maximum load capacity in compact design
- Extended life
- Reduced maintenance costs
- Easy to integrate into existing applications
- Modular construction allows very quick modifications
- Special designs available

Used by customers around the globe in:

- Vehicle and crane steering systems
- Manlift systems for boom and basket rotation
- Light crane systems
- Rotation of attachments such as excavators, grabs and fork lifts
- Handling equipment (automation systems)
- Loading and unloading devices
- Positioning systems / turntables

**IMO -
the driving force for
innovative technology**

Slew Drives
Introduction

A complete unit

- All components guaranteed to work together
- Easy to order - simple to install
- Eliminates component assembly
- One source - total system responsibility

Easy selection

- Complete line of various standard sizes
- Immediate, off-the-shelf availability
- Online sizing and selection programs available at www.goimo.com
- Extensive technical support

IMO Slew Drive in a totally enclosed housing

- Slew Drive protected from:
 - Contamination
 - Damage
 - Loss of lubrication
- Provides:
 - Extended life
 - Reduced maintenance costs
 - Enhanced operator safety
 - Sleek, clean appearance

Wide range of load capacities

- Peak torque up to 152610 Nm
- Tilting moment load up to 1052 kNm
- Raceway diameters: 205 up to 1091 mm
- Special designs are also available in larger diameters

WD-L Series

Product Description

- Worm drive
- High torque transmission
 - Complete toothed worm gear
 - Maximum load capacity and extended life
 - Reduced backlash
 - Self-locking and non-self-locking models

WD-H Series

Product Description

Seal

Axial bearing for the worm shaft

WD-L Slew Drives from IMO have an impressive combination of unique features.

WD-L series comprises **7 standard models**

WD-L Slew Drives Overview

WD-L 0223 Single Row Slewing Ring

WD-L 0223 Double Row Slewing Ring

WD-L 0343 Single Row Slewing Ring

WD-L 0419 Single Row Slewing Ring

WD-L 0419 Double Row Slewing Ring

WD-L 0478 Single Row Slewing Ring

WD-L 0625 Single Row Slewing Ring

IMO Slew Drives, with a wide range of **industry standard sizes** and torque capacities offer fast, cost effective slewing solutions.

Modular system enables the utilization of various motors
(e.g. WD-L 0419)

Basic version WD-L 0419 without motor

Version with hydraulic motor

Version with a three-phase electrical motor and spur gearbox

Drives are easily modified to meet special operating conditions.

Standard steel ring of a Double Row Slew Drive WD-L 0419, optimized for a high capacity, short cycle application

Modified worm gear of the WD-L 0419 made of bronze for applications with extended duty cycle

Worm shaft with appropriate worm gear (WD-L 0419)

WD-L 0419 with flanged spring energised multi-plate disk brake and motor, in a manlift system

The subsystem consists of a WD-L special design which is bolted to a base plate for a paver stone laying machine turning device

WD-L 0343 with the attached potentiometer, used in manlift systems

Frameless worm gear with integrated Slewing Ring suitable for extreme high temperatures for a forklift rotator (IMO is providing the worm gear and the customer is assembling them in its own housing)

Our WD-H family - which model do you need?

WD-H series comprises **6 standard sizes**

Standard units easily adaptable to meet specific applications (i.e: WD-H 0300)

WD-H Slew Drives Overview

Best possible application solution to meet our customers **design requirements**

The WD-H series is unique on the market!

Our design solution is protected by international patents, allowing IMO to offer the unique combination of high torque and tilting moment capacities in the industries smallest footprints.

SP-Slew Drives with totally enclosed housing.

Standard Slewing Ring mounting hole patterns provide full product interchangeability.

Overview

SP-L

SP-L, light series

- mounting hole patterns and height identical to IMO Ball Slewing Ring series 920
- ball diameter 20 mm
- module 4 mm
- direct drive

SP-I

SP-I, intermediate series

- mounting hole patterns and height identical to IMO Ball Slewing Ring series 120
- ball diameter 20 mm
- module 4 mm
- direct drive

SP-M

SP-M, medium series

- mounting hole patterns identical to IMO Ball Slewing Ring series 120
- height increased by base plate thickness of 15 mm
- ball diameter 20 mm
- module 6 mm
- one or multistage planetary gearbox

SP-H

SP-H, heavy series

- mounting hole patterns identical to IMO Ball Slewing Ring series 125
- height increased by base plate thickness of 15 mm
- ball diameter 25 mm
- module 8 mm
- one or multistage planetary gearbox

Examples of customer initiated special designs

SP-LE 0841

SP-L series Slew Drive with electrical motor and spur gearbox for handling equipment.

SP-HC 0755

SP-H series Slew Drive with two motor modules (hydraulic motor/planetary gearbox) for a ship rescue crane.

SP-HC 0655

Custom design with a feedback potentiometer as well as a planetary gearbox. Application is a rotation device for a special excavator attachment.

◀ **Heavy load transporters** present big technical challenges. Each single axle is steered by an IMO Slew Drive requiring the maximum axial, radial and tilting moment capacity. The **WD-H 0300** with steering torques of 27000 Nm is an excellent solution.

△ **Side loader** with the steering gears of the **WD-L 0223** and **WD-L 0419** series; the high operating time requires the use of bronze worm gears.

Straddle carrier with eight independently steered axles.

The combination of IMO steering gears with additional hydraulic, electrical and electromechanical components and the system integration into the vehicle enables an effective solution, including **"steering by wire"**.

We stand ready to work closely with an experienced design team to provide the optimum **Slew Drive** solution.

Unlike typical hydraulic push rod actuated steering solutions IMO Slew Drives offer 360 degree steering capability.

With the capacity to handle extreme tilting moments, high output torques, all in a compact design, the IMO **WD-H Slew Drives** are especially suited as **steering devices**.

In addition, integrated position feedback sensors support computer controlled steering systems.

Using IMO Slew Drives, cranes and special vehicles achieve **unique maneuvering capabilities** including turning on the spot.

Applications Steering Gears For Undercarriages

Undercarriage of a **harbor mobile crane** with **WD-HC 0300** steering gears; In combination with the hydraulic motor, the gear potentiometer indicates the position of the wheel.

In concrete factories, large **movable gantry cranes** displace heavy and bulky prefabricated concrete. With the Slew Drive **WD-HC 0645**, each axle can be turned individually. The steering torque required at the maximum load while turning on the spot is about 150000 Nm.

Ship lifting device to lift and place ships up to a weight of 650 tons. Eight Slew Drives of the **WD-HC** series carry this load capacity.

Small manlift on a crawler chassis with a **WD-L 0223** Slew Drive.

This bridge inspection equipment uses Slew Drive **WD-HC 0300** in the boom joint. The unit is able to accommodate the suspended loads and is fitted with a worm drive and multi-plate disk brake.

This working platform with a height of 35 m uses two IMO Slewling Rings on a synchronous rotating **turntable** which are driven by an IMO **WD-HC 0146** Slew Drive.

The high capacity and low profile of the **WD-L** series are perfectly suited for **manlift platforms**.

The wide variety of sizes in this series enables their use in many different kinds of platforms (heights ranging between 7 and 27 meters). Design standardisation "at its best"!

Telescopic working platform with a **WD-L 0419** Slew Drive.

Combining low unit weight and high capacity, the Single and Double Row Slew Drives of the series **WD-L 0223** perfectly match **basket rotator requirements** of large manlift systems.

The IMO Slew Drive, model **WD-L 0478** is used for **railway slewing cranes** used to position track sections.

This functional but elegant twin worm Slew Drive **WD-H 0645**, is ideally suited for the slewing gear of a **yacht crane**.

Light cranes - the standard equipment of **service trucks**, using the IMO **WD-L 0343** Slew Drive (also available with special flanges).

The special series **SP-IC 0841** with two direct hydraulic motors was developed for this **special crane**, used for roof top operations.

Cement mixer equipped with a conveyor belt with a length of 16.5 m, which is rotated with two **WD-LC 0419**; the considerable length of the belt leads to high tilting moments. Therefore a double row design with a reinforced housing is used.

This rotation and tilting device of a **front loader** uses an IMO Slew Drive, model **WD-LC 0419** with twin motors (double the torque).

Cemetery excavator with the IMO Slew Drive **WD-L 0343**.

To protect the teeth of this **demolition equipment** from overload damages, a friction coupling is integrated in the spur gear driven Slew Drive **SP-OP 0580** (OP= "overload protected").

Applications

Mining and Tunnelling

To ensure that the **blasthole boring tool** remains locked in place during the boring process, the **WD-HC 0220** shown has an integrated locking system with a position holding device.

Instead of a traditional large diameter toothed Slewing Ring, this **manipulator** uses a compact Slewing Drive **WD-HC 0373** with twin worm and locking brakes.

Slewing Drive **SP-HC 0698** with hydraulic motors and gear boxes for turning an **excavator boom**, part of a cutter bar of a tunnel boring machine.

Working in aggressive environmental conditions, the Slewing Drive **WD-HC 0373** is adapted for the use by a **crane in a salt mine**. Brakes ensure position holding at extreme crane decline.

SP-Slew Drives are used in **automation systems**. Picture: Slew Drive **SP-LE 0641** with three-phase electrical motor and spur gearbox.

▽ **Manipulator** for turning concrete parts with Slew Drive **WD-HE 0373**.

△ This is a **facility** to cover car fascia panels with leather. It contains Slew Drive **WD-HC 0300**. Because of its operating condition, it is fitted with a spring energised multi-plate disk brake.

Applications Positioning / Automation

Bank mower with Slew Drive **WD-L 0419**, double row series.

Slew Drives of **WD-series** fitted with electric motors used for the yaw and pitch controls of this **solar table**.

Technical Information

Symbols and units

B_h	h	Basic rating life in operating hours	M_k	kNm	Equivalent tilting moment including all occurring impact loads and required safety factors, calculated from all axial and radial forces that cause the tilting effect
C_{ax}	kN	Basic axial dynamic load rating	M_{kD}	kNm	Equivalent tilting moment including radial load and application service factor for determining the load point in the limiting load diagram
C_{rad}	kN	Basic radial dynamic load rating	M_W	Nm	Friction torque of the Slew Drive under operating load in the installed state
$C_{0 ax}$	kN	Basic axial static load rating	M_{WA}	Nm	Friction torque of the Slew Drive, unloaded
$C_{0 rad}$	kN	Basic radial static load rating	n	rpm	Operating speed of Slew Ring
D_L	mm	Raceway diameter (see Product Overview P. 4/5)	n_{perm}	rpm	Permissible operating speed of Slew Ring
ED_B	%	Duty	n_b	—	Number of fastening holes per bearing ring
$ED_B \cdot$	%/min	Duty per minute	SF1	—	Series SP: Safety factor against tooth base fatigue Series WD: Safety factor against tooth wear
$ED_{max} \cdot$	%/min	Maximum permissible duty of rotation per minute (see diagram series description)	SFS 1	—	Series WD: Safety factor against tooth fracture
f_a	—	Application service factor	SFS 1.75	—	Series SP: Safety factor against static tooth base fracture
f_{Md}	—	Ratio of operating torque to maximum torque	S_w	—	Calculation safety factor 1.3 for wear diagram
F_{ax}	kN	Equivalent axial load including all occurring shock loads and required safety factors, calculated from all axial forces	Q	l/min	Oil flow
F_{axD}	kN	Equivalent axial load including application service factor for determining the load point in the limiting load diagram	z_1	—	Number of teeth, pinion
F_{rad}	kN	Equivalent radial load including all occurring shock loads and required safety factors, calculated from all radial forces; the effective gearing circumferential force has to be considered	z_2	—	Number of teeth, Slew Ring

M_h	Nm	Maximum holding torque			

General

Function of Slew Drive

Slew drives comprise a highly robust Slew Ring provided with gear teeth (1), one or several toothed drive elements (2), a worm gear in this case, seal (3), housing (4) and a hydraulic or an electric drive (5). Slew Drives are designed for grease lubrication.

In a Slew Drive the rolling elements (6) carry the load between the inner ring (7) and outer ring (8). The raceway system's capacity is determined predominantly by Slew Ring design, the depth of hardening and the number and size of the rolling elements. Spacers (9) separate the rolling elements and minimise friction and wear.

Load distribution

Depending on external load, the load distribution contact and the angle around the rolling elements will vary.

- In the case of axial load, all rolling elements are loaded in the same direction.
- In the case of radial load, a segment of the rolling elements carries the load.
- In the case of tilting moment load, a segment on one side and a segment on the opposite side carry the load.
- Mostly, a combination of axial, radial and tilting moment loads occur.

Technical Information

- Axial loads can be “compressive” or “suspended”.
- A “suspended” axial load and the load on a rising segment in tilting moments must be adequately resisted by mounting bolts.

Caution: Catalog bolt data is not valid in this case!

- Radial loads must be transmitted by means of frictional contact between Slew Drive and the attached structure.
- A good bolt connection is vital for satisfactory function of the Slew Drive. Bolt connection and tilting clearance of a Slew Drive must be checked regularly.

All catalog bolt data is valid only for “compressive” loads!

Gear

Slew Drives of series WD are designed with worm gear. Slew Drives of series SP are designed with spur gear. Permissible torque is specified in the Technical Information section.

Drive

Drive is provided by either an attached hydraulic or electric motor. Both motor mountings as well as the shaft/hub connection conform to industrial standards, hence hydraulic motors available on the market can be mounted without difficulty. For electric motors, corresponding adapter pieces are necessary. The design specification for drive motors is undertaken by IMO, based upon rotational speed and torque information provided by the customer.

Housing

Housing is designed as a welded or cast component and adapted to the size of the Slew Drive. As a standard feature, housings are supplied with a priming paint.

Sealing

Polymer seals protect the Slew Drive from normal dirt penetration, dust and light sprayed water. For very dirty and wet environments, the seals shall be protected with pre-mounted labyrinth seals on the mounting structure. Performance and reliability of a Slew Drive depend strongly on avoiding ingress of contaminants to the interior of the unit.

Pressure washing must not be used to clean Slew Drives.

Operating temperature

Standard version IMO Slew Drives can be used in ambient temperatures from -20°C up to $+70^{\circ}\text{C}$.

Selection criteria

The following criteria must be considered for the correct selection of a Slew Drive.

Position of the output shaft

Vertical: Slew Drives of all series can be used (even with a self-locking gear).

Horizontal: Slew Drives of all series can be used with exception of series WD-H. Here, it is necessary to use a Slew Drive with a 2-start gear, since using gear with self-locking and external driving force does not ensure smooth (jerk free) operation.

Alternating: Slew Drives provided with self-locking gear cannot be used. Using a Slew Drive of series WD-H with 1-start gear without self-locking is possible only up to 10° inclination angle to the vertical, otherwise smooth operation cannot be guaranteed.

Slew Drives that are not self-locking can, as an option, be equipped with a locking brake, if required.

Loads

External forces such as axial load, radial load and tilting moment must lie below the static limiting load curve, as regards their operating load point. For this, please refer to the chapters “Static capacity of raceway” and “Mounting bolts”.

Shocks, vibrations

To account for the peculiarities of different applications, the shock factors for gears should be considered. Slew Drives of the series WD are not suitable for applications under permanent vibration.

Back load

Keep in mind that in the case of series WD Slew Drives, due to the high gear ratio, that in the case of back load (e.g. caused by boom impacting on obstacle), there is danger of irreparable damage to the worm gearbox, so long as the driving torque exceeds the maximum permissible table values $M_{d\max}$.

Torque

The operating torque may not exceed the maximum torque specified in the Technical Data section, calculated with application service factor 1. Explanations of different torque specifications are as follows:

Series SP:

Maximum torque $M_{d\max}$:

Slew Drive series SP-H, SP-M: Maximum torque is limited by maximum radial load of the planetary gear-set used.

Slew Drive series SP-L, SP-I:

The maximum torque is calculated with a safety factor against static tooth base fracture SFS 1.75.

Nominal torque $M_{d\text{nom}}$:

The nominal torque is calculated with a safety factor against tooth base fatigue SF1, at the rotational output speed specified in the Technical Data section, under one-way varying load.

Series WD:

Maximum torque $M_{d\max}$:

The calculation of the maximum torque with a safety factor against tooth fracture SFS 1 is done according to G. Niemann / H. Winter, Machine Elements, Band III, 1986, for worm gears and is influenced by:

- Limiting value of tooth base stress
- Module
- Gearing width

Nominal torque $M_{d\text{nom}}$:

The nominal torque is calculated with a safety factor against tooth wear of SF1,

- at the output speed specified in the table
- for a calculated service life of 10000 h
- at a duty of 5%

For Slew Drives with two motors, the specified values are valid for a slewing angle of $\leq 170^{\circ}$.

Series SP and WD:

Maximum holding torque M_h :

The maximum holding torque determines which retroactive torque can be transmitted or held without damage being caused to the gearing. In general, the value of the maximum torque is assumed.

Rotational speed

Slew Drive series SP:

The maximum permissible speed is $n_{\text{perm}} = \frac{40000}{D_L}$

Slew Drive series WD:

The maximum permissible speed is specified in the Technical Data section. For higher speeds, our Engineering Department should be consulted.

Duty

Slew Drive series WDs are designed for intermittent duty. Application with continuous running or with higher rate of duty and simultaneously high output torque are not permissible. This would lead to unacceptable temperature increase in the gearing and thus to premature failure of the Slew Drive. Transmission of the maximum torque is to be limited to 10% of each minute. Please check the diagram for the maximum permissible duty per minute of the respective series on P. 53 and P. 63.

Static capacity of raceway

Static capacity of the Slew Drive is determined by:

- Hardening depth of the raceway
- Number and size of the rolling elements
- Slewing Ring design
- Raceway geometry

The limiting load diagram shows permissible axial and tilting moment loads for a respective size unit.

Every loading case including the required or recommended safety must lie below the limiting load line.

Limiting load diagrams are valid under the following condition:

- Static loading
- Limiting load line with safety 1
- Clamping length of bolts, minimum 5-times, maximum 10-times the bolt diameter
- Continuous threads up to the bolt head is not permissible
- Bolts of quality class 10.9
- All mounting holes used
- “Compressive” load
- Adequately stiff and level mounting structure (see chapter “Installation and Maintenance Instructions” on P. 46 - 51)
- Minimum strength of the mounting structure 500 N/mm^2
- Radial loading considered as specified
- Compliance with “Installation and Maintenance Instructions”

Technical Information

To address the peculiarities of different applications, the following application service factors are to be considered in the prevailing loads:

Application	Application service factor f_a	Remark
Construction machinery	1.25	Normal operation
Forestry machinery	1.50	Rough operation
Foundries	1.75	Rough operation
Manlift platforms	1.30	Normal operation
Mech. engineering, general	1.25	Normal operation
Mech. engineering, general	1.50	Heavy operation
Measuring technique	2.00	Accuracy
Robot / mech. handling sys.	1.50	Accuracy
Rail vehicles	1.50	Rough operation
Special vehicles	1.50	Rough operation
Deep mining	1.75	Rough operation
Machine tools	1.50	Accuracy

Application service factors are to be considered in the following equations for the prevailing loads:

$$F_{axD} = F_{ax} \cdot f_a$$

$$M_{kD} = (M_k + 1.73 \cdot F_{rad} \cdot \frac{D_L}{1000}) \cdot f_a$$

To account for the prevailing radial load, the tilting moment is increased accordingly.

This equation applies only if:

$$F_{rad} \leq 220 \cdot \frac{M_k}{1000} + 0.5 \cdot F_{ax}$$

Should the value be exceeded, the limiting load diagram no longer applies.

Please contact our Engineering Department.

Calculation example:

Application: Slewing equipment for a construction machine under normal operation

Load:	Axial load	55 kN
	Radial load	6 kN
	Tilting moment load	86 kNm

Slew Drive: pre-selected SP-M 0741/2-05894

The following values are achieved with an application service factor of 1.25:

$$F_{axD} = 55 \cdot 1.25 = 68.75 \text{ kN}$$

$$M_{kD} = (86 + 1.73 \cdot 6 \cdot \frac{741}{1000}) \cdot 1.25 = 117.11 \text{ kNm}$$

At this point it can be verified in the limiting load diagram, whether or not the pre-selected Slew Drive is statically adequate.

If the operating load point lies below the limiting load line then the Slew Drive is statically adequately dimensioned. If loads frequently occur during the slewing process, the selected type should be reevaluated dynamically for lifespan. For this, please contact our Engineering Department.

Mounting bolts

Prevailing loads must be safely transmitted. To ensure this, mounting bolts should be sized to handle the raceway loading. The bolt curve is depicted in the static limiting load diagram, subject to the following conditions:

- Quote the fulfillment of the conditions in the case of considering the static load Slew Drive capacity of the raceway.
- Bolts are appropriately tightened with a torque wrench (bolt tightening factor $\alpha_A = 1.6$). For tightening torques, see table P. 48
- For Slew Drives with through holes, use the largest possible metric bolts with regular threads.

Caution: In the case of "suspended" loads, the bolts are subject to additional tensional forces.

Please contact our Engineering Department.

Static load carrying capacity of mounting bolts

Determining the operation load level, both with and without radial load, occurs along with the verification of the static load carrying capacity of the raceway.

If the prevailing load case lies below the limiting load line in the static limiting load diagram then the bolt connection is statically adequately dimensioned.

Dynamic load Slew Drive capacity of mounting bolts

Mostly, static dimensioning of a mounting bolt is sufficient. In cases where very high numbers of stress reversals act on the Slew Drive, dynamic verification is necessary. For this, please contact our Engineering Department.

Pressure lock of mounting bolts

When radial loads act on the Slew Drive, it must be ensured that these loads can be transmitted without shearing forces occurring inside the bolts. Therefore, it must be determined whether the radial load can be transmitted via frictional contact between the mounting structure and the Slew Drive.

$$F_{rad \max} = \frac{n_b \cdot F_{sp}}{18.8}$$

n_b = number of fixing holes per ring

F_{sp} = pre-stressing force on a mounting bolt

If the prevailing radial load exceeds the limit value, we request that you contact our Engineering Department.

For Slew Drives with a different number or size of bolts in the inner and outer ring, the permissible radial load is to be determined for both rings. The smaller value is the limiting value. Frictional contact prevails if $F_{rad \max}$ is greater than the prevailing radial load.

Slew Drives, series WD-H, are basically to be centralized.

Securing the mounting bolts

When a customer desires that the mounting bolts be secured, we recommend the following products (manufacturer specification is valid):

Loctite®

Application of Loctite 270 is suitable for the highest level of connections. This prevents loosening and the threads are also sealed.

Nord lock®

Nord lock, self-locking washers, are recommended for cases of vibration or dynamic loading cycles. Due to a pair of square tapered washers with tapered surface gradients between both Nord-lock securing washers greater than the gradient of the bolt threads, any loosening tendency of the bolt is immediately prevented.

Other bolt securing systems are not recommended.

Friction torque

The friction torque in Slew Drives depends upon many influence factors, e.g.:

- Rigidity and flatness of the mounting structure
- Load and loading combination
- Rotational speed and operating temperature
- Design of Slew Drive
- Number and frictional torque of seals
- Lubrication grease and level of filling
- Manufacturing tolerances
- Other factors

The friction torque of an unloaded Slew Drive can be determined approximately with the following equations:

Slew Drive series SP, with minimum Slew Drive clearance greater than zero

$$M_{WA} = 0.2 \cdot \frac{D_L^2}{2000}$$

Slew Drive series WD-L, with preloaded Slew Drive

$$M_{WA} = 2.0 \cdot \frac{D_L^2}{2000}$$

Slew Drive series WD-H, with preloaded Slew Drive

$$M_{WA} = 4.0 \cdot \frac{D_L^2}{2000}$$

The friction torque for a Slew Drive under load can be determined with the following equation, approximately:

$$M_W = 0.005 \cdot (4400 \cdot M_k + 4 \cdot D_L \cdot F_{rad} + D_L \cdot F_{ax}) + M_{WA}$$

Gear

Slew Drive series SP

Type of gear

Slew Drives series SP are provided with spur gear according to DIN 3960, DIN 3962 and DIN 3967.

If higher torque is necessary or longer operating lifespan is required, it is possible to manufacture the gear in tempered or hardened form.

Permissible torque

Corresponding data is available in the Technical Information section.

Drive pinion

The pinions used in different sizes are provided with hardened gear. In the Technical Data section you will find data about transmission ratios and numbers of teeth.

For the direct drive (SP-L, SP-I), the drive pinion is equipped with a radial bearing that is integrated in the motor flange.

In the case of Slew Drives equipped with planetary transmission, the drive pinion is mounted via the planetary transmission.

Technical Information

Tooth backlash

Tooth backlash is factory-set at the highest point of the gear. It depends on the module of the gear and is calculated according to the following formula:

Tooth backlash to be set = 0.03 to 0.04 • module

Slew Drive series WD

Design of the gear

Slew Drive series WD is designed with a hardened worm gear according to DIN 3960, DIN 3962 and DIN 3967,

Permissible torque

Corresponding data is provided in the published Technical Information section.

Worm shaft

Worm shafts are made of hardened steel, with ground tooth flanks.

Tooth backlash

The tooth backlash is set at approx. 0.3 mm for Slew Drive series WD.

Self-locking

Series SP Slew Drives

Series SP Slew Drives are not self-locking.

Series WD Slew Drives

Self-locking only exists in the case of series WD Slew Drives if it cannot be driven from the output side. Self-locking is directly related to the efficiency of the Slew Drive, which depends on very many factors, e.g.

- Lead angle
- Angle of friction
- Rotation speed
- Lubrication
- Material matching
- Surface finish, etc.

Theory indicates self-locking occurs if the gear efficiency is < 50%. Data in the Technical Data section conforms to this statement. However, it is vital to determine the actual existence of the self-locking characteristics in the supplied Slew Drive individually during actual usage.

We take no responsibility for conformity of the theoretical data in the Technical Data section with the practically prevailing self-locking or non-self-locking characteristics.

Shock coefficient

As for the applications in which impact is expected, the appropriate impact coefficients must be considered when determining the Slew Drives' maximum torque rating.

Lifespan

The expected lifespan of the gear depends on the operating conditions. The following factors are key:

- Torque
- Output speed
- Duty factor
- Ambient temperature, etc.

Lubrication

To ensure flawless operation and long usable life, adequate and regular lubrication is necessary. The grease fulfills the following functions:

For the raceway:

- Reduction of friction and wear in the rolling contacts
- Corrosion protection
- Lubrication of seals
- Additional sealing effect of the grease "collar"

For the gears:

- Smooth running
- Less wear
- Reduced operation noise
- Longer operating life
- Less heat development

Initial greasing

IMO Slew Drives are supplied pre-lubricated. High-quality lithium-complex grease, based on mineral oil, with EP-additives according to DIN 51825, KP2P-20 is the standard lubrication.

Regreasing intervals

Regreasing must be done at regular intervals, depending on frequency of use and ambient operating conditions. General attention must be paid to ensure that the grease used during the greasing is compatible with the sealing material. Special attention should be paid to ensure that lubricating grease types originally specified are used throughout the life of the unit.

Should you wish to use other types of grease, it must be verified whether the grease is compatible with that used for initial greasing. Please contact your grease manufacturer.

Please observe also the data in the "Installation and Maintenance Instructions" chapter.

Beside regular regreasing during operation, it is also necessary to grease the Slew Drive after long standstill periods. Equally important is to grease the equipment in which the Slew Drive is integrated after cleaning.

ATTENTION:

Slew Drives must not be cleaned with pressure washing equipment. During pressure washing, large amounts of pressurized water can penetrate into the Slew Drive through the sealing gap and cannot be removed, even by massive re-greasing. This will strongly reduce the usable lifespan of a Slew Drive.

Mixing greases

Grease with different thickener and base oil should generally not be mixed. The manufacturer should always confirm if different grease types can be mixed.

Shelf life of lubricants

Lubricants are subject to ageing even if unused. If after 3 years grease is not yet used, it should be replaced.

Design of mounting structure

Safe transmission of application loads and reliable operation of Slew Drives is achieved, along with other factors, through using adequately designed mounting structures.

To ensure safe operation of Slew Drives, there are certain minimum requirements to the mounting structure.

- Sufficient rigidity (see "Installation and Maintenance Instructions")
- Maintain flatness according to "Installation and Maintenance Instructions"
- No hard points (e.g. through cross beams)
- Surfaces for bolts must be machined plane
- Hollow mounting structure is preferred
- Use all mounting bolts
- Bolts of recommended strength should be used
- Minimum strength of attached structure 500 N/mm²

Very different mounting structure solutions can be used, depending upon maximum load and application.

If hollow mounting structure is designated for attached structure, flange thickness should be at least 50 % of Slew Drive's overall height. The thickness of the hollow mounting structure should be about 30% of flange thickness. For weight-critical applications, flange thickness can only be reduced if appropriate stiffening ribs are provided and the specifications on permissible flatness and perpendicularity deviations and deformation under load are upheld. Values on this are specified in the "Installation and Maintenance Instructions" P. 46 - 51.

A few simple steps for selecting a Slew Drive

You will find a detailed procedure on the following pages!

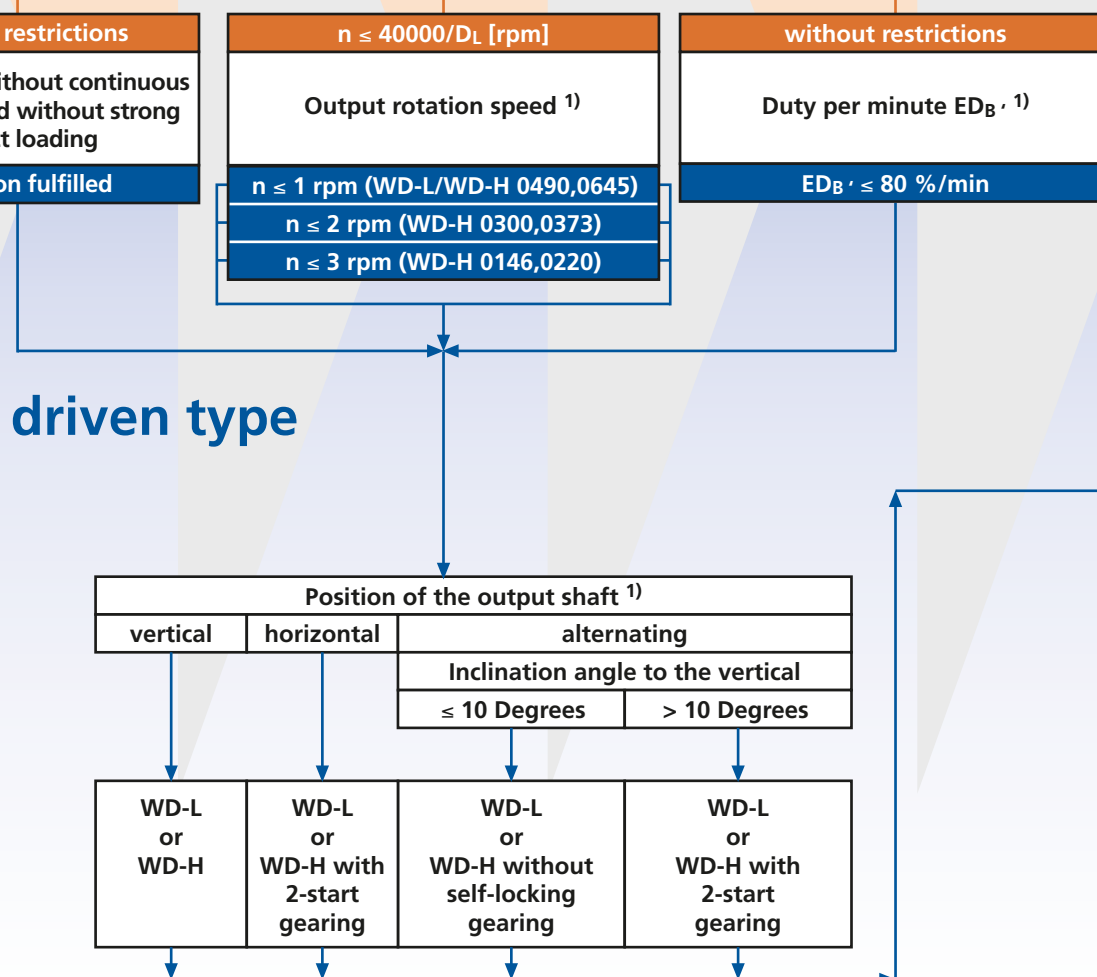

Spur gear driven type SP Series

START

Worm gear driven type WD Series

Selecting Slew Drive with larger maximum torque $M_d \text{ max}$

Selecting a Slew Drive using the limiting load diagram $1)2)$
Operating point must lie below the selected curve.

Selecting Slew Drive with a larger maximum torque $M_d \text{ max}$

Verifying the selected Slew Drive by IMO Engineering Department
Please fill out an Application Data Sheet and supply a sketch of the application.

SOLUTION

1) Selection criteria can be used only as rough typical values; if limit value is exceeded, please contact IMO.
2) Please accurately consider operating conditions.

Technical Information

Procedure for selecting a Slew Drive in only 5 steps:

Pre-selecting a suitable Slew Drive is described using the following example:

Example:

Application: Steering gears for an in-house transport vehicle; rough operation; limited assembly space; "compressive" load.

Load data:
 Axial load: $F_{ax} = 100 \text{ kN}$
 Radial load: $F_{rad} = 35 \text{ kN}$
 Tilting moment: $M_k = 75 \text{ kNm}$
 Operating torque: $M_{dB} = 13200 \text{ Nm}$
 Output speed: $n = 1.0 \text{ rpm}$
 Operating time: $B_h = 14000 \text{ h}$
 Duty: $ED_B = 5 \%$

Rotation cycle description under operating torque:
 60° rotation in 10 seconds in clockwise direction
 60° rotation in 10 seconds in counter-clockwise direction
 Pause for 40 seconds
 Operation of Slew Drive per minute:
 20 seconds rotating – 40 seconds standing still
 → 0,333 minute, rotating per minute
 → Duty per minute:

$$ED_B' = \frac{0,333}{\text{min.}} \cdot 100\% = \frac{33,3\%}{\text{min.}}$$

1. Step: Selecting a suitable design (WD or SP)

Comparing product characteristics

WD design:

- Exhibits high torque at low output speeds and transmits high tilting moments, axial and radial loads
- Attains highest capacity with smallest diameter configuration
- Flat design, due to tangentially located drives
- Provides high torque transmission (however, the duty must be taken into consideration)
- Self-locking and non-self-locking Slew Drives are available
- Non-self-locking Slew Drives can be equipped with locking brakes
- Consider the position of the output shaft when selecting the Slew Drive
- Not recommended in case of continuous vibrations and heavy impact loading

Typical application:
 Manlift platforms, steering gears for undercarriages of cranes and heavy-duty vehicles, loading cranes, turntables, forklift rotators, mining equipment, etc.

SP design:

- Enables higher output rotary speeds
- Very narrow in size around the Slewing Ring, but the drive is broad in axial direction
- Offers a large, open internal diameter
- Very suitable for upper structures with larger radial diameters
- Basically not self-locking in design
- Can be equipped with locking brakes
- The position of output shaft is insignificant
- Preferred design for vibration and impact loading applications

Typical applications:

Handling and automation equipment, packaging machines, tool changers, grippers, construction machines, land and forestry machines, etc.

Typical selection:

Worm gear driven types have proven themselves as steering gears. Features such as high torque, low output rotary speed with smaller assembly height and diameter clearly speak for the application of WD design. The smallest assembly height of a worm gear driven Slew Drive is provided by the WD-L series.

2. Step: Selecting a suitable design size in the limiting load diagram for "compressive" load:

A suitable Slew Drive is selected iteratively. For a pre-selected Slew Drive, (e.g. WD-L 0478/3-04995), an operation load point is calculated depending on external loading, the application service factor and the raceway diameter D_L .

Loading is permissible for raceway and bolt connection, provided that the operating point lies below the limiting load line of a pre-selected Slew Drive.

If the operation load point lies above the corresponding limiting load line, a Slew Drive with higher power rating must be selected, for which the limiting load line lies above the current operation load point. For the newly selected size, the operation load point must be calculated again and the permissibility of the new operation load point must be verified against the limiting load line.

On the contrary, if the operating load point also lies below the limiting load line of a smaller size, then, for this size, permissibility of the newly calculated operating point can be verified within the limiting load diagram.

This iterative approach is repeated until an optimally suitable size is determined, by which the operation load point lies below the corresponding limiting load line.

The following conditions must be fulfilled:

- Preconditions for limiting load diagram apply.

• Equation $F_{rad} \leq 220 \cdot \frac{M_k}{1000} + 0.5 \cdot F_{ax}$ fulfilled

Example:

- Preconditions for the limiting load diagram apply
- Verifying the operating parameters:

$$F_{rad} \leq 220 \cdot \frac{M_k}{1000} + 0.5 \cdot F_{ax}$$

$$35 \leq 220 \cdot \frac{75}{1000} + 0.5 \cdot 100 = 66.5 \quad (\text{condition fulfilled})$$

Calculation of the operation load point:

Application service factor $f_a = 1.5$ (special vehicles)

Raceway diameter for WD-L 0478/3-04995: $D_L = 478 \text{ mm}$ (see product program overview / compare P. 4 and P. 5)

$$F_{axD} = F_{ax} \cdot f_a$$

$$F_{axD} = 100 \text{ kN} \cdot 1.5 = 150 \text{ kN}$$

$$M_{kD} = (M_k + 1.73 \cdot F_{rad} \cdot \frac{D_L}{1000}) \cdot f_a$$

$$M_{kD} = (75 + 1.73 \cdot 35 \cdot \frac{478}{1000}) \cdot 1.5 = 155.9 \text{ kNm}$$

The operation load point lies below the limiting load line of the selected Slew Drive WD-L 0478/3-04995 and is permissible. The operation load point of the selected Slew Drive lies above the limiting load line of the smaller size, which would not be permissible. A Slew Drive that is larger than the selected Slew Drive WD-L 0478/3-04995 would not be the best solution from the economic point of view.

Technical Information

Step 3: Static reliability verification of operation torque M_{dB} :

The following condition must be fulfilled:
Operating torque $M_{dB} \leq$ maximum torque $M_{d \max}$
(see series overview WD-L P. 52)

Example: $13200 \text{ Nm} \leq 24288 \text{ Nm}$ (condition fulfilled)

Slew Drives WD-L 0419/3-04553, WD-L 0419/3-04684, WD-L 0478/3-04995 and WD-L 0625/3-06290 can statically transmit the operating torque M_{dB} .
Since the operation load points of series WD-L 0419/3-04553 and WD-L 0419/3-04684 lie above their limiting load lines (cf. Step 2), the size WD-L 0478/3-04995 selected in Step 2 has to be selected. If the operating torque M_{dB} is greater than 24288 Nm, then WD-L 0625/3-06290 must be selected; in this example, however, WD-L 0625/3-06290 is not an economical solution.

Maximum torque $M_{d \max}$ of individual sizes

Step 4: Verifying the maximum permissible duty per minute ED_{\max} :

The following condition must be fulfilled:

- Preconditions for the diagram of maximum permissible duty per minute ED_{\max} apply (see series overview WD-L P. 53)

Duty per minute $ED_B \leq$ maximal permissible duty per minute ED_{\max}
(see series overview WD-L P. 53)

Example:

- Pre-conditions for the diagram of maximum permissible duty per minute ED_{\max} apply.

Verifying the condition: $ED_B \leq ED_{\max}$

Duty per minute $ED_B = 33.3 \text{ \% / min}$

Determining the maximum permissible duty per minute (see series overview WD-L P. 53)

$$\text{Factor } f_{Md} = \frac{M_{dB}}{M_{d \max}} = \frac{13200 \text{ Nm}}{24288 \text{ Nm}} = 0.543$$

Maximum permissible duty per minute

$ED_{\max} = 46 \text{ \% / min}$

Verifying the condition: $ED_B \leq ED_{\max}$

$33.3 \text{ \% / min} \leq 46 \text{ \% / min} \rightarrow$ condition fulfilled

Duty per minute is permissible.

Step 5: Verifying wear characteristics of worm gear

The following condition must be fulfilled:

- Preconditions for wear diagram apply (see series overview WD-L P. 53)

$$\text{Limit value } G_w \geq \text{operation time } B_h \cdot \frac{\text{duty } ED_B}{100}$$

Example:

- Preconditions for wear diagram apply

$$\text{Verifying the condition: } G_w \geq B_h \cdot \frac{ED_B}{100}$$

Determining the limit value G_w at the operating torque M_{dB} from the diagram for the selected Slew Drive WD-L 0478/3-04995 (see series overview WD-L S. 53)

$$\text{Verifying the condition: } G_w \geq B_h \cdot \frac{ED_B}{100}$$

Limit value $G_w = 1500$ hours (from diagram)

$$B_h \cdot \frac{ED_B}{100} = 14000 \text{ hours} \cdot \frac{5 \text{ \%}}{100} = 700 \text{ hours}$$

$1500 \text{ hours} \geq 700 \text{ hours} \rightarrow$ condition fulfilled

Operation is permissible as regards wear characteristics.

Result:

Verification as regards:

- Suitability of design
- Load carrying capacity of raceway and bolt connection in the limiting load diagram
- Permissibility of the operating torque
- Maximum permissible duty per minute
- Wear characteristic of worm gearing was considered and the Slew Drive WD-L 0478/3-04995 evaluated as applicable in all aspects.

Verification of the selected Slew Drive by IMO is recommended.

Please enclose Application Data Sheet and a sketch of the application (see P. 108 and P. 109).

Installation and Maintenance Instructions for Slew Drives (EW ST Rev. 5.02)

Preface

The following instructions give you the information you need to be able to correctly install and maintain an IMO Slew Drive.

These instructions replace earlier versions for series SP and WD. All instructions are provided with a revision number. Installation and maintenance instructions with previous revision numbers are invalid. The latest version is published on our homepage and can be downloaded from there (www.goimo.com). Please always check that you are working with the latest revision!

These instructions shall be attached to your product or to the final product or to the Installation and Maintenance Instructions. All work steps listed here are to be executed by suitably qualified personnel.

Please do not hesitate to contact our Engineering Department for any further assistance.

Contents

0. Transport, handling and storage provisions

0.1 Transport, handling and storage

1. Installation

1.1 Preparation for installation

- 1.1.1 Cleaning the Slew Drive and the mounting structure
- 1.1.2 Determining permissible deviations and/or deformation of mounting structure
- 1.1.3 Lubricating or checking oil level
- 1.1.4 Choice of mounting bolts
- 1.1.5 Choice of tightening torques

1.2 Installing the Slew Drive

- 1.2.1 Positioning the Slew Drive
- 1.2.2 Securing the Slew Drive with bolts
- 1.2.3 Determining the existing tilting clearance
- 1.2.4 Operating test

2. Maintenance / safety checks and lubrication

- 2.1 Checking the mounting bolts
- 2.2 Checking the tilting clearance
- 2.3 Checking the rotational clearance of series WD
- 2.4 Relubrication or checking oil level
- 2.5 Relubrication intervals
- 2.6 Lubricants

IMO accepts no liability for:

- 1. Non-compliance with Installation and Maintenance Instructions.
- 2. Failure to pass on content to third party.

Notice

The following text includes special notices and procedures that shall be observed. Technical properties of Slew Drives are found in our product catalog or in the technical offer.

0. Transport, handling and storage provisions

0.1 Transport, handling and storage

Transport only in horizontal position. Impacts shall be avoided.

Wear work gloves when handling the Slew Drives.

Slew Drives are generally provided with threaded holes in which eye bolts can be fixed. This enables safe handling on a hoisting device. Please observe relevant legal regulations when doing this.

Store only in a horizontal position and in closed rooms. The surface corrosion protection holds for approx. 3 months in closed packaging. Longer storage periods require special protective measures.

1. Installation

1.1 Preparation for installation

1.1.1 Cleaning the Slew Drive and the mounting structure

1. Remove extraneous material from supporting surfaces (including paint residue, welding beads, burr formation)
2. Clean corrosion protection coating from supporting surfaces of the Slew Drive.

In doing this, ensure that:

- Cleaning material does not penetrate into the Slew Drive.
- Applicable provisions for cleaning media are observed (e.g. manufacturer provisions, protection of workers, environment protection).
- Cleaning material that attacks the sealing material is not used.

Applicable cleaning materials:
Cold solvents (e.g. white spirit, diesel oil, Kaltryl KEV etc.)

1.1.2 Determining permissible flatness deviation δ_p , perpendicularity deviation δ_w and the permissible deformation δ_v of the mounting surface of the supporting structure

Table 1: Permissible flatness including perpendicularity deviations for Slew Drives series WD-H

Size of Slew Drive	146	220	300	373	490	645
Flatness including perpendicularity deviation per supporting surface [mm]	0.06	0.06	0.07	0.07	0.08	0.09

Table 2: Permissible flatness including perpendicularity deviations for Slew Drives series WD-L and all SP

Raceway diameter [mm]	100	250	500	750	1000	1250
Flatness including perpendicularity deviation per supporting surface [mm]	0.04	0.06	0.08	0.09	0.10	0.11

Table 3: Permissible deformation of mounting structure under maximum load for Slew Drive series WD-H

Size of Slew Drive	146	220	300	373	490	645
Deformation of mounting structure per support surface [mm]	0.10	0.11	0.12	0.13	0.15	0.16

Table 4: Permissible deformation of mounting structure under maximum load for Slew Drive series WD-L and all SP

Raceway diameter [mm]	100	250	500	750	1000	1250
Deformation of mounting structure per supporting surface [mm]	0.13	0.16	0.21	0.24	0.27	0.29

For Slew Drives between specified sizes, the closest smaller value shall be taken. For Slew Drives larger than type 645, the value for size 645 shall be used. For Slew Drives with a raceway diameter above 1250 mm, the value for 1250 mm shall be used.

The size of Slew Drives (WD-H) or raceway diameter D_L (WD-L, SP) can be found on our Drawings.

Permissible perpendicularity deviation δ_w (tilting) is based on the actual flange width and may only amount to one half of the values in Table 1 and 2.

The maximum residual value for flatness deviation δ_p (waviness) along the circumference may total to only once per 180 deg. The form must resemble a sine curve that gradually rises and falls.

Sketch: Permissible curve of flatness deviation of the mounting structure and flatness and perpendicularity deviations on the mounting structure

Installation and Maintenance Instructions for Slew Drives (EW ST Rev. 5.02)

1.1.3 Lubricating the Slew Drive or checking oil level

Slew Drives are supplied fully lubricated. They shall be greased again prior to initial operation. It is essential to use the grease specified on the delivery drawing. Suitable grease types for normal cases are listed on Table 9.

1. Inject grease into the grease nipples one after the other while rotating the drive until a bead of fresh grease forms at least on one sealing lip.
2. For Slew Drives equipped with an intermediate device using gears (For example: Planetary gear), the oil level should be checked and refilled if necessary. For this see Installation and Maintenance Instructions of the intermediate transmission manufacturer.

1.1.4 Choice of mounting bolts

Prescribed sizes, number and quality grades shall be used.

- Grip ratio (grip length to diameter of bolt) shall be observed, from minimum ≥ 5 to maximum ≤ 10 .
- Bolts with a fully threaded shaft are not permissible.
- Slew Drive function, lifespan, and durability can be affected in case of non-compliance.
- When the permissible interfacial pressure is exceeded, use suitable washers of appropriate size and strength.
- Do not reuse bolts, nuts and washers.

Table 5: Permissible interfacial pressure for different materials

Materials	Max. surface pressure in N/mm ²
St52 / C45N / 46Cr2N	420
42CrMo4V	700

1.1.5 Choice of tightening torques

Mounting bolts are in normal cases adequately secured by correct preloading.

- Mounting bolts can be secured by Loctite. Nord-Lock bolt lock washers may be necessary in case of shock loading or vibration.
- Use of split rings, split washers, etc. is not permissible.

Table 6: Tightening torques for mounting bolts according to DIN13

Mounting bolt	Tightening torque $M_A^{1)}$ in Nm			Mounting bolt	Tightening torque $M_A^{1)}$ in Nm		
Dimension	8.8	10.9	12.9	Dimension	8.8	10.9	12.9
M4	2.25	3.31	3.87	M16	168	246	288

¹⁾ M_A according to VDI-guideline 2230 (February 2003) for $\mu_k = 0.08$ and $\mu_c = 0.12$

1.2 Installing the Slew Drive

1.2.1 Positioning the Slew Drive

1. Determine the main load-carrying zone.
2. For all Slew Drives except series WD-H, the soft spot of the bearing raceway shall be placed at a 90° point to the maximum load zone. The soft spot is designated with a filling plug or a punched "S" mark.
3. With a gauge, check whether the supporting surface of the Slew Drive is fully supported by the mounting structure.

1.2.2 Securing the Slew Drive with bolts

The Slew Drive shall be mounted in the unloaded condition. First the housing or toothless bearing ring is attached and then the worm wheel or the gear bearing ring.

The following procedure shall be followed in order to avoid deviations between bolt tightening forces.

1. Lightly lubricate bolt threads and head in order to ensure uniform frictional resistance (does not apply to bolts with adhesive).
2. Preload the bolts, including washers, if required, crosswise in 3 steps - 30%, 80%, 100% of the tightening torque.
3. Repeat the procedure for the worm wheel / bearing ring.

When applying a hydraulic fastening device, the tightening forces for preloading shall not exceed 90% of yield stress.

1.2.3 Determining the existing tilting clearance

The tilting clearance increases with additional raceway wear. To determine the increase in tilting clearance, it is necessary to take basic measurements after installation prior to putting the drive into operation for the first time.

- Permanently designate the measuring point in the mainload direction.
- Record all measured values.

Procedure

1. Determine and mark the measuring point at the point of load, both on the housing as well as on the worm wheel or on the gear ring.
2. Fix the dial gauge – see sketch.
3. Apply the defined tilting torque, minimum of 50% of the maximum operational load in "A" direction.
4. Set the dial gauge on zero.
5. Apply the defined tilting torque, minimum of 50% of the maximum operational load in "B" direction.
6. The measured difference between "A" and "B" corresponds to the tilting clearance and serves as the basis for comparison for later inspections.

- All subsequent measurements are performed at the same measuring point, with the same loads, at the same position of the housing relative to the worm wheel or gear ring and in the same sequence.
- All the measured values are to be recorded.
- For purely axial or radial loads, tilting clearance is inspected by applying an additional tilting load.

1.2.4 Operating test

If the mounting bolts are properly tightened and the drive motor is correctly connected, then the Slew Drive shall rotate uniformly. Deviations of the mounting structure and the effect of extraneous loads can strongly impact the friction torque.

1. Rotate mounted Slew Drive several times.
2. Check whether Slew Drive runs smoothly without jumping.
3. Perform further test runs under full load.

After operating test, recheck the tightening torques of mounting bolts.

2. Maintenance / safety checks and lubrication

2.1 Checking mounting bolts

To compensate for possible settling, it is necessary to retighten the bolts to the prescribed torque. This shall be done without externally loading the bolts after the first 100 hours in operating. This inspection shall be repeated after every 700 hours in operation. The inspection period may be reduced under special operating conditions. In case of loose bolts, replace all bolts, nuts and washers with new ones.

Installation and Maintenance Instructions for Slew Drives (EW ST Rev. 5.02)

2.2 Checking the tilting clearance

Wear in the raceway system leads to increased tilting clearance. It is therefore necessary to check the clearance after 700 operating hours, or at the latest after 6 months.

Checking the increase in tilting clearance δ_k directly on a Slew Drive

For the procedure to check the increase in the tilting clearance, see P. 48 and P. 49.
The value (m1) determined after installation of the Slew Drive is considered as the basic value and is deducted from the latest inspection value (mx). The difference between mx and m1 may not exceed 0.45 mm

$$\delta_k = mx - m1 \leq \delta_k \text{ perm}$$

$$\delta_k \text{ perm} = 0.45 \text{ mm}$$

Checking the increase in tilting clearance δ_k not directly on Slew Drive

Increase in tilting clearance is to be converted proportionally for each measurement (after the installation measurement) and compared with δ_k permissible.

For both checks:

- Reduce the inspection interval to 200 operating hours if the measured increase in tilting clearance amounts to approx. 75% of the maximum permissible increase in tilting clearance.
- Reduce the inspection interval once again after further increase in tilting clearance (to 50 – 100 operating hours).
- Replace the Slew Drive if the maximum permissible increase in tilting clearance is reached.

2.3 Checking the rotational clearance of series WD

Gear wear leads to increased rotational backlash. Therefore it is necessary to check the rotational backlash after 700 operating hours, at the latest after 6 months. The values specified in Table 7 for rotational backlash shall not be exceeded.

Procedure

1. Determine and permanently mark the measuring point in the main loading zone, both on the housing as well as on the worm wheel or on the gear ring.
2. Secure the Slew Drive against rotation.
3. Remove the drive to enable the worm wheel to be easily rotated by hand.

- For front-end-brake application (brake flanged between motor and Slew Drive), the brake shall be removed with the motor.
- For an application with a brake mounted to the Slew Drive, the brake shall be disengaged.
- For a Slew Drive with an attached permanent brake (series WD-L), the brake shall be removed.

4. Determine the rotational play of the worm shaft.
5. The established rotational play serves as the basis for comparison after later checks.

- All subsequent checks are performed at the same measuring point, at the same position on the housing and worm wheel or gear ring relative to another and in the same sequence.
- All measured values are to be recorded.

Table 7: Rotational play – limit values

Module of Slew Drive gearing	Rotational play – limit value	Module of Slew Drive gearing	Rotational play – limit value
3	34°	6	28°
4	32°	6 / 2 start	14°
4 / 2 start	16°	7	28°
4.5	31°	7 / 2 start	14°
5	30°	8	27°
5 / 2 start	15°	8 / 2 start	13.5°

The size of the module is listed on the unit name plate.

- Reduce the inspection intervals to 200 operating hours if the measured rotational play amounts to approx. 75% of the maximum permissible limit value.
- Reduce the inspection interval once again after further increase (to 50 – 100 operating hours).
- Replace the Slew Drive if the maximum permissible rotational play is reached.

2.4 Relubrication of Slew Drive or checking oil level / oil change

Grease types specified in the delivery drawing shall be used. Suitable substitute lubricants can be found in Table 9.

Legal and manufacturer provisions about handling the respective lubricants must be observed.

1. While rotating the Slew Drive, inject grease into all the cleaned grease nipples consecutively until a bead of fresh grease forms at least on one seal or at the bearing gap.
2. Ensure that old grease can flow out of the drive freely.
3. For Slew Drives equipped with an intermediate transmission device (ie - planetary gear), oil shall be changed according to manufacturer instructions.

2.5 Relubrication intervals

Relubrication intervals depend mainly on the prevailing work and environmental conditions as well as on the version of the Slew Drive.
Exact relubrication intervals can only be determined by tests under actual operating conditions.
Intermediate transmissions are filled with oil; prescribed maintenance intervals are found in the maintenance instruction of the respective manufacturer.
In case no comparative results are available, the following table can be used for a reference value.

Table 8:

Work conditions	Grease-filled Slew Drive Lubrication intervals
Dry and clean workshop (rotary tables / robots, etc.)	every 300 hours of operation or once every 6 months
Difficult conditions in open grounds (crane / bulldozer, etc.)	every 200 hours of operation or once every 6 months
Aggressive climatic conditions sea/deserts/ Arctic climate/very dirty surrounding/more than 70 operating hours per week	every 150 hours of operation or once every 4 months
Extreme conditions (tunnelling machines/steel mills)	every 50 operating hours, at least, however, every 2 months

The specified values are valid for the following conditions:

- Operating temperature on Slew Drive < 70° C
- Circumferential velocity < 0,5 m/s for SP Slew Drives
- Driver rotational speed < 5 rpm for WD Slew Drives
- Low to medium loads

The table can never replace values established through experience; the most frequent cause of failure of Slew Drives is insufficient lubrication.

Slew Drives shall generally be relubricated:

- After every cleaning.
- Before and after long inactive periods, e.g. for cranes and construction machines during winter months.
- Cleaning a Slew Drive with steam jet or high-pressure cleaner is not permissible!

2.6 Lubricants

Table 9:

Supplier	Product name	Applicable temperature range in °C	
Avia	Avialith 2 EP	-30	+130
Bechem	High-Lub L 474-2	-20	+120

Fuchs	Renolit Duraplex EP2	-30	+160
Rhenus	Norplex LKP2	-20	+150

Series Overview

Maximum torque $M_{d \max}$ of individual sizes

Limiting load diagrams of individual sizes for "compressive" load
Please refer to the explanations in the Technical Information section of the catalog

Due to the high gear ratio and the large surface contact between worm and worm gear, very high torque values can be transmitted using very small sized Slew Drives (highest power density). Worm gear driven Slew Drives of the light series WD-L are short-cycle drives for rotation and swiveling applications. Use in continuous rotation applications is not permissible due to higher duty. The duty should be selected so that over-heating around the gearing contact cannot occur. Diagram 2 exhibits the maximum permissible duty per minute, depending upon operation torque. When this maximum permissible duty per minute ED_{\max} is exceeded, the permissibility must be checked by the IMO Engineering Department.

The following conditions apply when determining the maximum permissible duty per minute and when verifying the wear characteristic of worm gearing:

- Output speed: $n = 1.0$ rpm
- Wear safety factor of worm gearing: $S_W = 1.3$
- Observance of the maximum permissible duty ED_{\max} (see diagram 2)
- Ambient temperature 20°C

Determining the maximum permissible duty per minute ED_{\max} :
The maximum permissible duty per minute should never be exceeded

ED_{\max} : Maximum permissible duty per minute in percent per minute [% / min] (see diagram 2)

$$f_{Md} = M_{dB} / M_{d \max}$$

f_{Md} : Ratio of operating torque to maximum torque [-]

M_{dB} : Operating torque [Nm]
 $M_{d \max}$: Maximum torque [Nm] (see diagram 1)

Wear characteristics of the worm gearing:

G_W : Limit value [h] (see diagram 3)
 B_h : Operation time [h]

The operation is permissible as regards wear characteristics, if the following relationship prevails:

ED_B : Duty in operation [%]
 M_{dB} : Operating torque [Nm]

$$G_W \geq B_h \cdot \frac{ED_B}{100}$$

If this relationship is not fulfilled, a high rate of wear must be expected.

Limiting load diagram for 'compressive' load

Series Overview

Maximum torque $M_{d \max}$ of individual sizes

Limiting load diagrams of individual sizes for "compressive" load
Please refer to the explanations in the Technical Information section of the catalog

Due to the high gear ratio and the large surface contact between worm and worm gear, very high torque values can be transmitted using very small sized Slew Drives (highest power density). Worm gear driven Slew Drives of the heavy series, WD-H, are short-cycle units for rotation and swiveling applications. Use in applications with continuous rotation is not permissible, due to the higher duty. The duty is to be selected so that over-heating around the gearing contact cannot occur. Diagram 2 exhibits maximum permissible duty per minute, depending upon operation torque. When this maximum permissible duty per minute ED_{\max} is exceeded, the permissibility must be checked by the IMO Engineering Department.

The following conditions apply when determining the maximum permissible duty per minute and when verifying the wear characteristic of worm gearing:

- Output speed: $n = 1.0$ rpm
- Wear safety factor of worm gearing: $S_w = 1.3$
- Observance of the maximum permissible duty per minute ED_{\max} (see diagram 2)
- Ambient temperature 20°C

Determining the maximum permissible duty per minute ED_{\max} :

The maximum permissible duty per minute may never be exceeded

ED_{\max} : Maximum permissible duty per minute in percent per minute [% / min] (see diagram 2)

$$f_{Md} = M_{dB} / M_{d \max}$$

f_{Md} : Ratio of operating torque to maximum torque [-]

M_{dB} : Operating torque [Nm]
 $M_{d \max}$: Maximum torque [Nm] (see diagram 1)

Wear characteristics of the worm gear:

G_w : Limit value [h] (see diagram 3)
 B_h : Operation time [h]

The application is permissible as regards wear characteristics, if the following relationship prevails:

ED_B : Duty [%]
 M_{dB} : Operating torque [Nm]

$$G_w \geq B_h \cdot \frac{ED_B}{100}$$

If this relationship is not fulfilled, a high rate of wear must be expected.

Series Overview

Maximum torque $M_{d \max}$ of individual sizes

Limiting load diagrams of individual sizes for “compressive” load

Please refer to the explanations in the Technical Information section of the catalog

Verifying tooth base fatigue strength:

Valid for the following conditions:

- Output speed: $n = 5.0$ rpm
- Repeated load
- Ambient temperature of 20°C

M_{dB} : Operation torque [Nm]

$M_{d \text{ nom}}$: Nominal torque [Nm] for $SF = 1$ and $n = 5.0$ rpm (see dimensions table)

If the following equation is met, the stress level of tooth base is below the endurance limit and fatigue is infinite:

$$M_{dB} \leq M_{d \text{ nom}}$$

Fatigue stress of tooth base needs to be considered however, if the following equation is met (if so, refer to below additional steps to verify life):

$$M_{dB} > M_{d \text{ nom}}$$

The operation is permissible as regards the fatigue stress of tooth base, if the following equation is fulfilled.

$$G_w \geq B_h \cdot \frac{ED_B}{100}$$

If this relationship is not fulfilled, then there is imminent danger of fatigue fracture of the tooth base.

G_w : Limit value from diagram [h]

B_h : Operation time [h]

ED_B : Duty [%]

Verification of the pitting and wear safety of tooth flanks must be done by the IMO Engineering Department!

Limiting load diagram for 'compressive' load

Series Overview

Verifying tooth base fatigue strength:

Valid for the following conditions:
- Output speed: $n = 5.0$ rpm
- Repeated load
- Ambient temperature of 20°C

$M_d B$: Operation torque [Nm]
 $M_{d \text{ nom}}$: Nominal torque [Nm] for $SF = 1$ and $n = 5.0$ rpm (see dimensions table)

If the following equation is met, the stress level of tooth base is below the endurance limit and fatigue is infinite:

$$M_d B \leq M_{d \text{ nom}}$$

Fatigue stress of tooth base needs to be considered however, if the following equation is met (if so, refer to below additional steps to verify life):

$$M_d B > M_{d \text{ nom}}$$

The operation is permissible as regards the fatigue stress of tooth base, if the following equation is fulfilled.

$$G_w \geq B_h \cdot \frac{ED_B}{100}$$

If this relationship is not fulfilled, then there is imminent danger of fatigue fracture of the tooth base.

G_w : Limit value from diagram [h]
 B_h : Operation time [h]
 ED_B : Duty [%]

Maximum torque $M_{d \text{ max}}$ of individual sizes

Limiting load diagrams of individual sizes for "compressive" load

Please refer to the explanations in the Technical Information section of the catalog

Verification of the pitting and wear safety of tooth flanks must be done by the IMO Engineering Department!

Weight		[kg]	295

*Optional with brake

The selection of the hydraulic / electric motor depends on actual customer requirements and specifications.

Selection example: performance data with hydraulic motor 2-132

Pressure differential	Δp [bar]	195
Oil flow	Q [l/min]	64
Output speed	n [rpm]	3
Maximum achievable torque	M_d [Nm]	47180

Limiting load diagram for 'compressive' load

Please adhere strictly to the Technical Information section when using above graph!

Size 0955

Note, mounting face against upper surface shall be $\varnothing 955$, minimum

Mounting holes

Y = 30 Holes M20-40 deep, equally spaced
Z = 30 Holes $\varnothing 22$, equally spaced

Lubrication ports

4 Taper type grease nipples on the internal diameter
2 Taper type grease nipples on the outside of the housing

Slew Drive supplied pre-lubricated

Drawing reference number SP-H 0955/2-05915			
Module	m	[mm]	8
Number of teeth, wheel	z₂	[-]	134
Number of teeth, pinion	z₁	[-]	15
Overall gear ratio	i	[-]	161.65
Maximum torque	M_{ld max}	[Nm]	51888
Nom. torque sf = 1 at n = 3 rpm	M_{ld nom}	[Nm]	36342
Maximum holding torque*	M_h	[Nm]	51888
Static load rating, radial	C_{o rad}	[kN]	1123
Static load rating, axial	C_{o ax}	[kN]	3006
Dynamic load rating, radial	C_{rad}	[kN]	328
Dynamic load rating, axial	C_{ax}	[kN]	383
Weight		[kg]	320

*Optional with brake

The selection of the hydraulic / electric motor depends on actual customer requirements and specifications.

Selection example: performance data with hydraulic motor 2-132

Pressure differential	Δp [bar]	195
Oil flow	Q [l/min]	70
Output speed	n [rpm]	3
Maximum achievable torque	M_d [Nm]	51888

Limiting load diagram for 'compressive' load

Notes

For custom configurations, we also supply material certificates according to EN 10204-3.1. B. This certificate logs the actual values of material characteristics such as tensile strength, apparent yielding point, notched bar impact work, extension and chemical analysis.

Material tests are performed according to the latest industry recognized methods (i.e. ultrasonic testing-developed by the Fraunhofer Institute).

Quality Assurance
EN ISO 9001:2000 certified

Quality Assurance

EN ISO 9001:2000 certified

***We want
you to be
satisfied!***

IMO Slew Drives have to meet the highest quality requirements because they are often used as safety critical components. Development, design, calculation and sales are performed strictly according to EN ISO 9001:2000 certified procedures.

The quality chain starts with the choice of the raw material (i.e. for the production of seamless rolled rings of the SP-series) and is continuous, including the ongoing testing of the current production series.
