

ROLLON®
Linear Evolution

Tecline

Our **tecline linear system** range is suitable for the handling of loads from 10 up to 1000 kg, by manufacturing **one or more axis systems** according to the customer **requirements**.

Our main application fields are: **robotics**, **palletization**, production **line**, **logistics** and **manufacturing machines** with Cartesian axis movements.

Our products stand out for their:

- **easy** and quick assembly
- **high quality** and **competitive** performances (profiles up to 12 m)
- **reduced** and simplified **maintenance**
- wide **range** of **integrated solutions**
- possibility of **customised solutions**
- **constant** technical **support** and CAD drawings available

Our Tecline linears strong points are:

- Solid beams obtained from aluminium alloy extruded profiles
- High-performance aluminium casting alloy plate and preset for tool assembly
- Adapting plate suitable for any commercial available gearboxes
- Fixed and oscillating roller slides, which can be adjusted through an eccentric bushing
- Without play and sealed rollers with a "for life" lubricating system
- Induction hardened and machined strong V-shaped steel guide rails
- Adjustable limit stops provided with rubber buffers
- Wide range of accessories for 3 or more axis linears

Construction characteristics

Multiple-axis linear modules with rack drive

TECLINE linear systems are designed for ROBOTS with one, two or three CARTESIAN AXES and comprise Rollon linear modules with rack drive, in different sizes depending on the load to be translated. Modules with rack drive are suitable for transfer and positioning systems with an extremely low repeatability error and/or for dynamic performance and heavy loads.

They can be equipped / supplied with gearboxes.

Whatever the application, the configuration can be adapted using the complete order code, within an extensive range of components (energy-chains, guides, micro-switches, lubrication units, etc.) and accessories.

Our technical dept. is available to provide assistance with code setting.

Beams

Manufactured with Rollon s extruded and anodised (*) profiles, made of hardened and tempered aluminium alloy Al Mg Si 0.5, quality F25, Rm 245 N/mm, tolerance according to UNI EN 755-9. Profiles are specifically designed by Rollon to create rigid and light structures, suitable for manufacturing linear transfer machines. The guide and rack housings on modules equipped with ball roller slides (PASM family) are milled.

(*) Valyda and Logyca profiles are anodised up to 12 m. Pratyca and Solyda are anodised upon request

Modules can be supplied with head-pieced beams, upon request

Plates

Manufactured with flattened extra-fine rolled sections made of high-performance casting alloy (tensile strength, Rm = 290 MPa, HB = 77). Standard plates can be machined according to drawings (code D).

V-shaped guide rails, PAR version

Made of specially treated high-carbon steel. Standard versions include induction hardened rails section 28.6x11, 35x16 and 55x25 (max. length 4000 mm). Joints bevel cut at an angle of 20°.

Roller slides, PAR version

Body in aluminium alloy G AL SI 91 hardened and tempered according to EN AB 46400, rollers with double rows of angular contact ball bearings, backlash-free, long life lubrication: Ø 30, Ø 40, Ø 52, Ø 62 mm rollers. Adjustable tolerance between rollers and guides. Complete with wiper scraper.

Caged ball roller slides and guide rails, PASM version

Systems are supplied with caged ball roller slides. The cage included in the slides has two purposes: it reduces the friction between the guide rail and the slide and prolongs their service life, and allows lubrication refills to be performed more rarely. The modules and guide rails are suitable for composing sections more than 10 m long. The assembled guide rails have a run parallelism of less than 0.030 mm. The assembly of caged ball roller slides and guide rails normally also involves the machining of the related seat in the profile (code M).

Racks / Toothed pinions

Racks with helical teeth, made of induction-hardened steel and hardened and tempered alloy steel, are available with three different modules: m2, m3 and m4.

PAR versions with guide rails and roller slides, assembled with ground, KSD induction-hardened racks with pinions in high-performance tempered and surface-hardened steel (RD). PASM versions with guide rails and caged ball roller slides, are normally assembled with KSD induction hardened racks with pinions in hardened and tempered RD steel. High-performance KRD racks are available upon request (Rs>900 MPa): hardened and tempered, induction-hardened, and fully ground (page TL-56). With RD pinions, KRD racks and continuous lubrication, speeds of up to 5 m/s can be reached.

Stop bumpers

Important: the rubber stop bumpers provided with standard linear models are suitable and regarded as static limit switches. For special needs, such as stops if the drive breaks, please specify loads, dynamics, details and discuss the use of specific parts, accessories and devices (reinforced plates and attachments - shock absorbers, anti-drop devices, etc.) with our technical dept.

Energy chains or accessories

Energy chains are provided upon request, together with a wide range of accessories. Adjustable brackets and supports are included. Standard sizes are those shown in the catalogue. Energy chains and accessories can be added using the order code on page TL-11.

Anti-oxidation parts and coatings

Rack modules with anti-oxidation coating are available upon request. Materials with special coatings and lubrication are selected according to the environment of use (food industry, health sector, marine environment, exposure to weather, etc.)

A - Features of the system with roller slides

The translation system consists of a plate to which two roller slides with concentric pins and two with eccentric pins are fixed. The eccentric pins help to adjust the tolerance between the roller slide and the sliding track. Check that the angular position of the rollers is such that they can support the max. working load. See page TL-62 and TL-68.

A - Assembly and adjustment of the roller slide.

Check the sense of direction of the roller slide as shown in point A. Check the alignment. Bring the roller slides with concentric pin into contact with the sliding tracks. Adjust the eccentric pins until there is no clearance and the carriage can slide easily along the bar.

IMPORTANT: overloading is easily achieved: this may result in premature wear.

NOTE: always keep friction low: if friction is high, loosen and repeat the adjustment.

No adjustments are required with guide rails and recirculating caged ball linear guides. For high-precision applications, please order low-backlash roller slides.

B - Alignment

All profile anchor supports must be perfectly aligned (with axes side by side: perfectly parallel and coplanar). When mounting the linear axes in parallel, it is necessary to not only verify the parallelism between the linear units themselves, but also the coplanarity of the surfaces of the heads so that the maximum error does not exceed 0.3 mm per meter between the parallel modules and within ± 0.03 mm compared to the parallelism."

C - Assembly of racks

The axis of the teeth and the guide rails must be parallel within tight tolerances. In the PASM version, the rack seat and the seat of the guide rails for the caged ball roller slide guides are machined together to ensure the correct assembly and positioning accuracy of the axis.

D - Tightening specifications and precautions

Make sure all parts are locked with the appropriate screws and with the right tightening torques.

E - Gearboxes

Supplied upon request. The use of right-angle reduction gears with hollow shaft and key is recommended. With this configuration the gearbox adapting plate is complete with shaft, pinion and step bearing. Otherwise, upon request, the adapting plate can be machined according to customer specifications and the pinion, if obtainable from the standard version. Backlash between the pinion and rack is only adjusted if the gearbox is supplied (or available).

Accuracy

The accuracy of this system is based on the tolerance of:

1. guide rails
2. rolling parts
3. transmission chain (e.g. rack and pinion)

V-shaped guide rails

Made of specially treated high-carbon steel alloy. Their accuracy is shown in the figure below and they are supplied in the following version: induction-hardened with a special grinding process.

Hardness: induction hardened min. 58HRC;

Rolling parts

Rollers with double rows of angular contact ball bearings to absorb axial force have a low friction coefficient (± 0.03) and are complete with sliding sealing rings.

Roller tolerance and radial backlash are in line with DIN 620 parts 2 and 3 (except for the convex external ring $R=500$ mm), while the load and calculation coefficients comply with DIN ISO 281 and with DIN ISO 76.

Guide rails and caged ball roller slides

As a general rule, these are generally supplied in “normal” accuracy classes. Thus, they are suitable to ensure the appropriate combination of positioning precision, stiffness and self-alignment required for standard industrial applications.

Higher levels of accuracy with low backlash are available upon request.

Lubrication

Rack and pinion

These parts must be lubricated regularly with a gear grease (for high working pressures).

An automatic, programmable system is available to ensure correct lubrication of the teeth (page TL-61).

The tangential force and torque values shown in the table on page TL-61 refer to properly lubricated racks.

Rollers and roller slides

Roller slides and V-shaped rollers are provided with a permanent lubrication system. If properly used, this eliminates the need for any further maintenance, also considering the average life of handling devices.

Do not use solvents to clean rollers or roller slides, as you could unintentionally remove the grease lubricating coat applied to the rolling elements during assembly. However, grease may be added slowly to lithium soap according to DIN 51825 - K3N.

V-shaped guide rails

If properly assembled, with the felt scraper in place, these guides do not require any lubrication, which could attract impurities and have negative consequences.

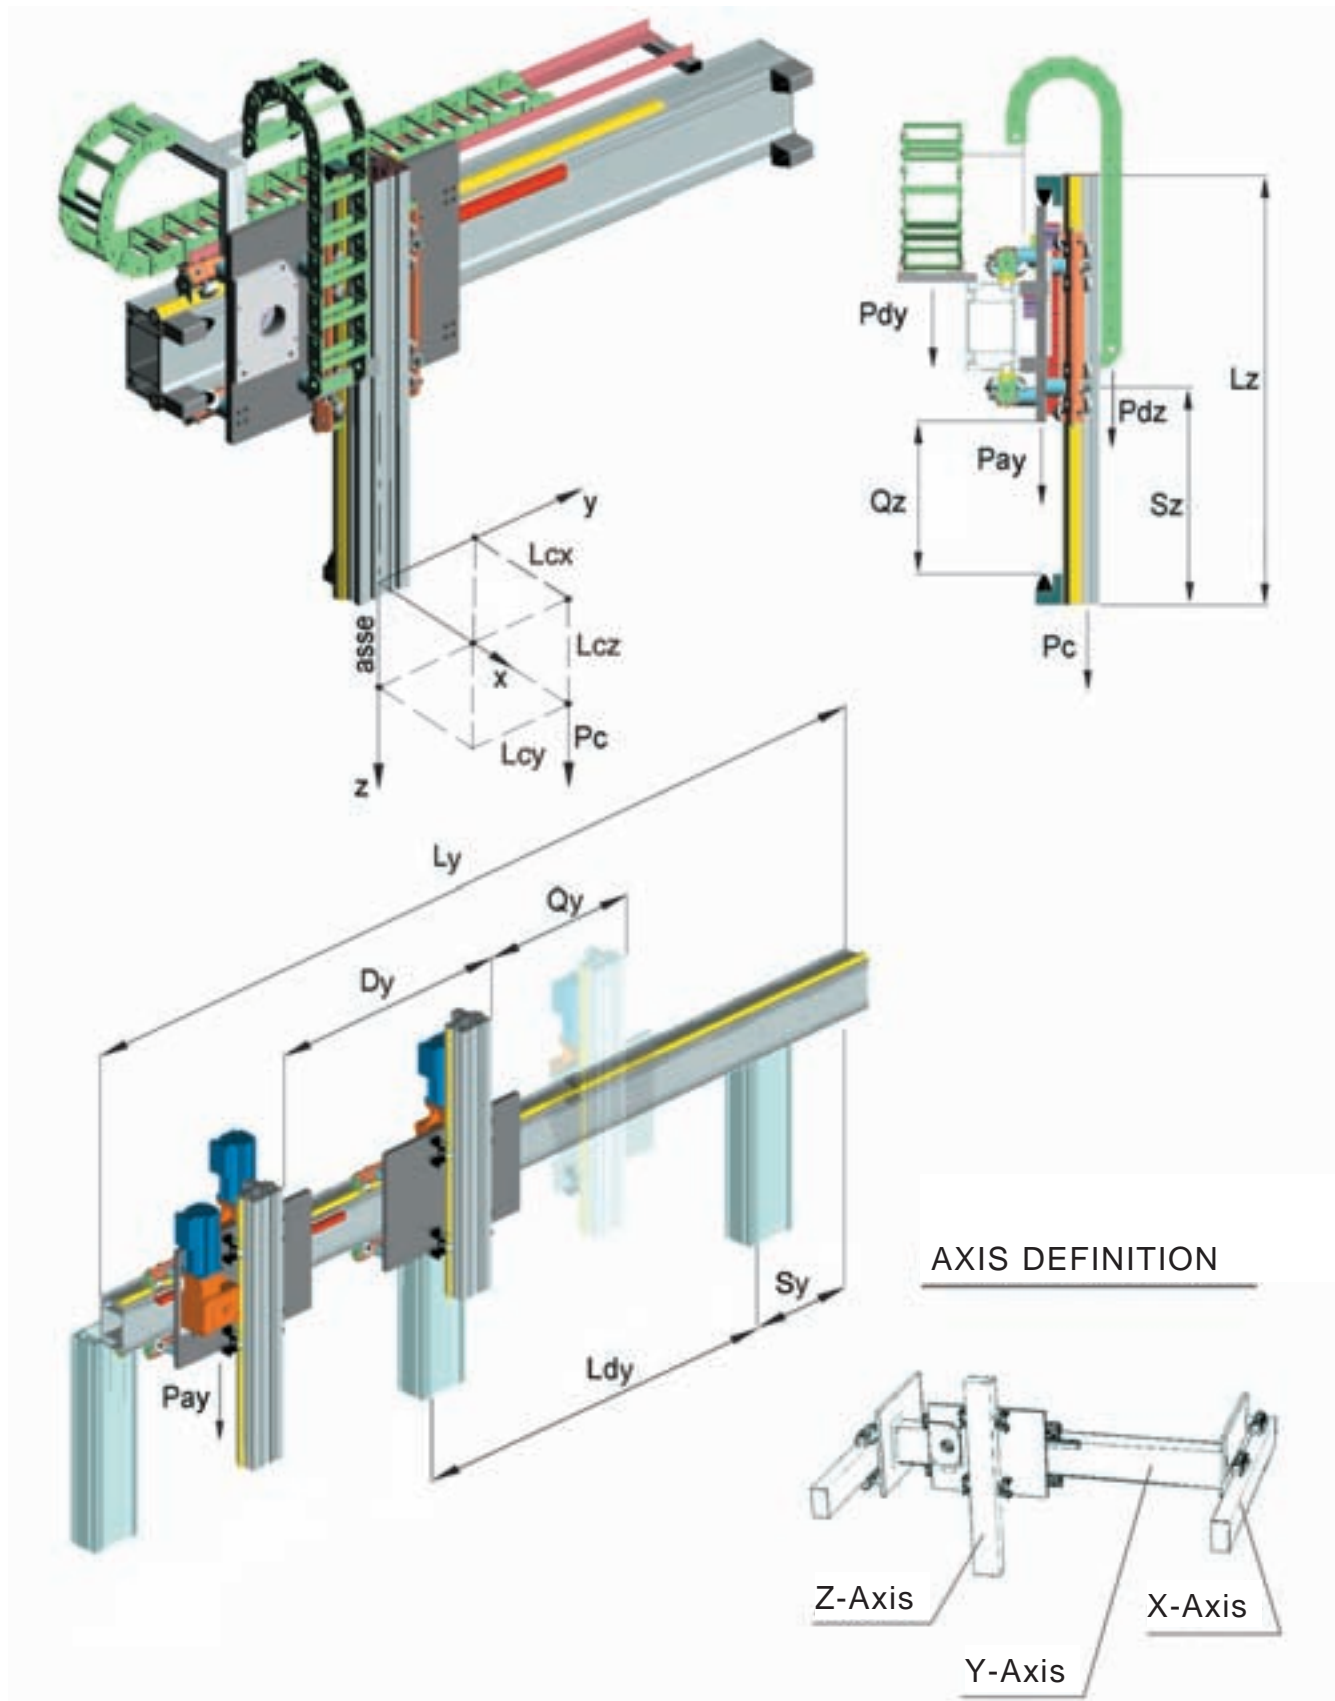

Guide rails and caged ball roller slides

Due to the cage keeping the ball bearings apart, these units are regarded as permanently lubricated; considering the average life of handling devices, no maintenance is needed before 5000 Km. For applications where dynamic performance is required, our technical dept. will consider the need for special seals or suitable tanks or lubrication systems.

Sizing template

Our **technical department** is available to check sizing calculations. Please fill in the form with all the necessary data and send it to our technical dept., which will recommend the most suitable size according to the forces applied and precision required.

For a correct design of the system, please fill the form below and send it to our technical dept.

Preliminary selection table (1-2-3 axes)

These tables are useful for making a preliminary selection with load applied in a central position with respect to the plate or profile axis. Z axis length is < 1,600 mm.

Deflection is computed assuming continuous beams having the same span and concentrated static loads.

In the following table, select the appropriate X axes according to the load.

	PA	2X	3X	4X	5X	6X	8X	10X	LC
	Deflection								
Max load capacity [kg.]									
50		1,4							5000
100		1,8							5000
200		2,7	1,8						5000
300			2,3	2,7					5000
400				3,3	2,4				5000
500					2,8	1,8			5000
600						2			6000
800							2,5	1,8	6000
1000								2,1	7000

N.B. per i PA 8X e 10X verticale compensare il carico.

In the following table, select the appropriate Y-X axes according to the load.

	PA	2/1	3/1	4/1	5/2	6/2	8/3	6/4	8/6	10/6	10/8	LC
	Deflection											
Max load capacity [kg.]												
50		1,9										5000
100		2,4	1,7	2	1,6							5000
200					2,2	0,8	0,8					5000
300						1,6	1,6	1,6				6000
400								1,9	2	0,9		6000
500									2,2	1		6000
600									2,5	1,2	1,2	6000
800											2,2	7000

In the following table, select the appropriate X and Y-Z axes according to the load.

		Y-Z-axes											
		PA	PA	2/1	3/1	4/1	5/2	6/2	8/3	6/4	8/6	10/6	10/8
		load [kg.]		100	100	100	200	200	300	400	600	600	700
X-axis	2X	(200)											
	3X	(300)											
	4X	(400)											
	5X	(500)											
	6X	(600)											
	8X	(800)											
	10X	(1000)											

NB: The choice of X axis is based upon the actual load, the supporting points, max. deflection and the total weight of the Y-Z axes.

EXAMPLE: selection of 3-axis system with roller slides

(Please see page TL-10 and the system pages for the nomenclature)

DATA: Total working load 300 kg, X axis stroke: 5,000 mm, Y axis stroke: 4,000 mm, Z axis stroke: 2,000 mm, support points: 2

By analysing the table of Y-Z axes based on the working load (Pc), profile length (Ly) and deflection, the selection falls on one PA 8/3 (load 300 kg.) system.

Check: $P_{eff} = P_{max} - (Lz - 1,600)/1,000 \cdot q_z = 300 - (2,900 - 1,600)/1,000 \cdot 35 = 254.5 \text{ kg.} < \text{di } 300 \text{ kg (not sufficient)}$.

Therefore select the larger size PA 6/4 (max. load capacity 400 kg.)

$M_{totY+Z} \text{ PA } 6/4 = M_{base} + (q_y \cdot \text{stroke}_{Q_y} + q_z \cdot \text{stroke}_{Q_z})/1000 + P_c = 244 + (66 \cdot 4,000 + 48 \cdot 2,000)/1,000 + 300 = 904 \text{ kg.}$

$P_{totX} = M_{tot} \text{ PA } 6/4 (Y+Z) \cdot 0.66 = 596.6 \text{ kg.}$

$Lx = \text{stroke}_x + 1,200 \text{ approx.} = 5,000 + 1,200 = 6,200 \text{ mm}$

By analyzing the table of X axes based on the load (P_{totX}) profile length (Lx) and deflection, it is possible to select 2 linear axes PA 6X

Chosen composition: n°1 PA 6/4 + n° 2 PA 6X

Perform a final analysis by computing the deflection based on the actual size of the spans.

Our technical dept. is at your complete disposal to help you examine the most suitable applications for your requirements and help you ...with motor and drive sizing for the whole project.

- 1/5 Pick and place system with twin vertical axis and rack and pinion drive for the production of panels in the construction industry.
- 2 Pipe handling system in welding plant.
- 3/6 Multicarriage handling system with separate rack and pinion drive for each X and Y axis.
- 4 Shuttle system for 6-axis of SCARA robot.
- 7 Column lift - load 100 kg - stroke 17 m.

V-shaped
guide rail 55x25

Features	28.6x11	35x16	55x25	
Moment of inertia I _x	2,148	7,932	41,906	mm ⁴
Moment of inertia I _y	14,490	36,405	194,636	mm ⁴
Weight	2	3.5	7.8	Kg/m

Machining: drilled guide rails with straight cut

Machining provided for guide rails with no joint. In addition to the code, please state the type of machining required by adding:

P_ _ -..... V-shaped guide rails, length L, **not drilled**

P_ _ -.....F V-shaped guide rails, length L, **drilled**

Size	Treatment	Max. Length	P	I	A	B	C	Code
28.6x11	hardened anti-oxidation	3980	150	40	11	7	5	P28.....
35x16	Induction-hardened	4100	100	50	11	7	7.5	P35.....
55x25	Induction-hardened	4100	150	25	18	11	11.5	P55.....

Machining: drilled guide rails with 1 bevel and 1 slanting cut

Machining provided for the crop down sizes of guide rail ends with joints. In addition to the code, please state the type of machining required by adding:

P_ _ -.....X V-shaped guide rails with 1 slanting cut, length L, **not drilled**

P_ _ -.....FX V-shaped guide rails with 1 slanting cut, length L, **drilled**

*: the first hole is drilled at a height of "Y", subsequent ones at a centre-distance of "P".

Size	Treatment	Max. Length	P	Y	I	A	B	C	Code
28.6x11	hardened anti-oxidation	3,850	150	50	50	11	7	5	P28.....
35x16	Induction-hardened	4000	100	50	50	11	7	7.5	P35.....
55x25	Induction-hardened	3950	150	25	25	18	11	11.5	P55.....

Machining: drilled guide rails with 2 slanting cuts

Machining provided for the intermediate crop down sizes of guide rail ends with multiple joints. In addition to the code, please state the type of machining required by adding:

P_ _ -.....XX V-shaped guide rails with 2 slanting cuts, length L, **not drilled**

P_ _ -.....FXX V-shaped guide rails with 2 slanting cuts, length L, **drilled**

*: in order to maintain a constant hole pitch, arrange the guide rails so that the length "L" is equal to: $n \cdot P + 2 \cdot Y$

Size	Treatment	Max. Length	P	Y	A	B	C	Code
28,6x11	indurita antioss.	3700	150	50	11	7	5	P28.....
35x16	Induction-hardened	4000	100	50	11	7	7.5	P35.....
55x25	Induction-hardened	3950	150	25	17	11	11.5	P55.....

EXAMPLE OF ORDER: n° 2 pieces **P55-1000FXX**

V-shaped guide rail assembly inserts

Material: C40 galvanized steel.

A and C: suitable for medium profiles (see pages TL-14 - TL-15)

B and D: suitable for load-bearing profiles (see pages TL-12 to TL-15)

Inner diameter (Øi)

Features and treatment

Programmable Automatic Rack Lubrication System

Grease is delivered by means of a programmable cartridge (average life: ca. 1 year) (a).
The grease is spread evenly on the racks through a felt pinion (1). You will need one kit per rack.

1- Spares

Specification	Code
Programmable grease cartridge (125 ml) [b]	101.0744
m2 - helical tooth felt pinion [1]	101.1079
m3 - helical tooth felt pinion [1]	116.0050
m4 - helical tooth felt pinion [1]	116.0051

2 - Lubrification assembly kit

Specification (see figure C)	Code
Lubrification assembly kit (no felt pinion, no riscan pipe)	736.0332

Table for selecting maximum operating torque

Table 1 – With lubrication guaranteed under ideal load conditions, dynamics, (1 m/s) with rigid pinion support [Nm].

Module	Pinion / Racks - Helical tooth			
	Z [n°]	Øp [mm]	KSD	KRD
2	21	44.56	150	200
	30	63.66	205	265
3	20	63.66	400	500
	28	89.13	500	650
4	18	76.39	880	1000
	25	106.1	1150	1500

Example of simplified calculation

To obtain the working torque value, divide the maximum operating torque (Tab. 1) by the safety factor (Tab. 2). Intermediate values can be adjusted according to the application.

Motion (A) = High shock 1.75

Speed (B) = Low 1

Lubrication (C) = Constant 0.9

Rack = module 3 KSD

Pinion = Øp 63.66 (400 Nm)

Safety factor = A x B x C = 1.575

Motion (A)	Speed (B)	Lubrication (C)	Safety fac. (AxBxC)
Low shock 1.25	Low 1	Constant 0.9	1.13
Medium shock 1.5	Medium 1.25	Daily 1.2	2.25
High shock 1.75	High 1.5	Monthly 2.5	6.56

Tab.2

Maximum transmissible torque = Maximum torque 400 / Safety factor 1,575 ≤ 254 Nm

For heavy-duty applications, please ask our technical dept. to carry out the appropriate checks.

Connection shafts

Tecline

The Tecline range includes a series of hollow shafts for connecting the pinions on the systems. We can supply standard connections, according to your application requirements. The complete kit includes all the components needed to make the connection, with shrink-discs and crop down sizes of pins for insertion into the pinions.

Type 1 - Elastic joint with connecting shaft, suitable for low speeds with center-distance and length of up to 2 m.

Type 2 - Stainless steel blade joint connecting shafts, for backlash-free transmissions

Type 3 - Stainless steel blade joint connecting shafts and support bearings, suitable for backlash-free transmissions

Assembly of standard carriages / K version carriages

IMPORTANT: for applications with high projecting loads, the rollers of the slides must be adjusted so that the load is supported by the maximum possible number of rollers. If this means arranging the rollers symmetrically with respect to the standard roller slide version, please add the letter K at the end of the code when filling in the order form. However, the roller assembly can also be inverted at a later date, by disassembling the pins and rollers and then **reassembling them in the opposite way**.

Example:

Anti-drop device with pneumatic brake system

Tecline

Ant-droop devices, available in a range of sizes, are supplied according to the type of application. For instance, they can act as a mechanical stop to block the free-falling load at any stroke point, or as a lock in static conditions at any position.

Two-way blocking occurs following an unexpected pressure drop.

A mechanical release system is available on request (patented). Catalogue available upon request.

The kit includes: braking device and rod with relative supports, micro-switch. Solenoid valve available upon request.

Operating pressure 3-6 Bar.

With no pressure = locked.

Lock-pin (stopper cylinder)

Lock-pins are available in two sizes to block the vertical axes in position to allow horizontal movements during maintenance. The lock-pins comprise the use of the through rod. Select the size according to the load. The kit includes: drilled plate for rod, stopper cylinder, micro-switch and 2 magnetic gearboxes.

Max. operating pressure: 10 bar.

1- Lock-pin

End caps for profiles

The end caps for STATYCA, VALYDA, and LOGYCA (supplied with 4 bushings 207.1892 thr. M20/6) are fixed to the profiles using the 4 holes provided in the centre that must be M20 threaded. PRATYCA and SOLYDA profiles must instead be M6 drilled and threaded as in the areas indicted in the drawing (in this case the end caps are supplied without any bushings). Please specify whether profiles will require end caps.

Material: black polyethylene, 6 mm thick. End caps in 6 mm-thick aluminium alloy are available upon request.

Bearing profile	L	h	A	B	C	D	Code
202.1753 - STATYCA	170	120	100	50	-	-	212.1774
